EXECUTIVE SUMMARY

Enrollment Forecast Summary

After a period of fairly substantial reductions during the early part of the last decade, APS enrollment stabilized over the past five years. Due to factors cited in this report, total system enrollment (all grade levels) is projected to grow modestly over the next five years and then slowly trend downward after 2015. Enrollment changes will not be uniform among grade levels, attendance areas or SRTs. Volatile economic and housing market conditions create added uncertainties which could impact these forecasts, particularly in the short term.

Total APS enrollment is forecasted to increase by 1,270 students, or 2.8%, between 2009-10 and 2014-15. Total enrollment will then decline by 397 students, or 0.8%, from 2014-15 to 2019-2020. Changes in year-to-year enrollment (particularly between 2011 and 2015) will largely be due to smaller cohorts entering and moving through the system in conjunction with larger cohorts moving through and leaving the system. As in-migration of young adults continues and larger grade cohorts enter into the school system, total enrollment is expected to grow in the short term. However, after 2016 total enrollment will begin to decline. After 2011 the district's elementary enrollment will begin a slow decline as the larger cohorts enter middle school. High school enrollment should continue to increase and plateau by 2019. APS system-wide enrollment forecasts by grade level are summarized on the following page. Detailed forecasts for SRT's, school attendance areas and individual schools are presented in the full report. Key findings which support the enrollment forecasts include the following:

Atlanta Population and Housing Market Trends Influencing APS Enrollment

1. From 2005 to 2010, Atlanta's total population is estimated to have increased by 60,050, or 12.6%, to 537,760. From 2010 to 2015, the population is forecasted to continue to increase by an additional 33,510 persons or 6.2%. While during the entire 10-year period all of the elementary attendance areas are forecasted to increase in total population, the rate of growth all parts of the City is expected to slow (by half) after 2010.

2. "Delayed demographic reaction" is a key issue when attempting to ascertain the impact of new housing on school enrollment, as the full impact of new home construction is not seen immediately in elementary enrollment. APS is currently absorbing the effects of the 2001-2006 housing boom that has ended and will be replaced by dramatically slower rates of new housing construction over the next ten years. The City of Atlanta experienced an average of over 8,000 new housing units constructed per year from 2001 to 2006. From 2007 to 2009 the average rate of new construction dropped to 2,500 units per year. This APS enrollment forecast anticipates that the City will experience slower housing construction in the future, averaging 1,000 new units per year through 2014 and only 750 per year from 2015 through 2019.

3. Atlanta population and housing forecasts are based on modest expectations for recovery and growth of the local and regional economy over the next decade. The City of Atlanta is working on several economic development initiatives which could possibly result in a higher rate of future economic growth. The redevelopment of Ft. McPherson, the Atlanta BeltLine and other projects could potentially generate more housing demand and new construction in some parts of the City than are incorporated into this forecast. However even if successful, the timing and demographic effects of City economic development initiatives would not begin to influence APS enrollment until the out years of the forecast at the earliest. Impacts could be more significant after 2020.

4. More than 54% the Atlanta's estimated 232,200 housing units are multi-family and nearly 83,500 City households (49.1%) are renters. Roughly 78% of the 45,000 new housing units added to the City over the past decade were multi-family and a significant portion of those were also rental units. Because of the recent real estate downturn and foreclosure crisis, Atlanta now has a substantial inventory of vacant housing, estimated by some sources to be in the 20% range. Our analysis also found that in many parts of the City, student yields from multi-family housing are higher than single family homes, which suggests that the majority of APS students live in rental housing. In addition, large numbers of public housing units in Atlanta have been closed and demolished in recent years and those residents have relocated to rental housing located elsewhere in the City and the region. The temporary effects of the movement of those households may still be impacting some attendance areas and individual schools. The combination rental market volatility, more frequent movement of renter households, higher student yields in multi-family housing and current abnormally high vacancy rates adds complexity to

making APS enrollment forecasts. Changes in rental market conditions could influence APS enrollment in some attendance areas the short term, particularly those with high concentrations of multi-family housing.

5. As the district continues to have less new home construction, the rate and magnitude of existing home sales will become the increasingly dominant factor affecting the amount of population and enrollment change in owner-occupied housing. In most cases, it takes 20 to 30 years before all original (or first time) owner occupants of a housing area move out and are replaced by new, young families with children. As a result of the "empty nest"

syndrome, the attendance areas in the Atlanta Public Schools district will see a steady rise in the median age of their populations, even while the district as a whole continues to attract some new young families.

Private Education Trends Influencing APS Enrollment

6. During the 2009-10 school year, nearly 6,300 Atlanta residents were identified as enrolled in either private schools or home study/home school programs. (Not including charter schools.) This estimate represents 11.4% of the nearly 55,000 Atlanta resident school-aged children who were enrolled in public, private or home schools during the past year. Compared to the rest of Georgia, Atlanta has an above average percentage of its residents who are enrolled in private schools and a below average proportion of students who are educated in home-school settings.

7. Since 2005 and through the beginning of the 2009-2010 school year, reported participation in private education among Atlanta residents has increased at an 8% annual rate. Nearly half of Atlanta' private school population is enrolled in six local schools, while the remaining 50% is distributed among another 70 schools located throughout the City and in surrounding suburbs.

8. The largest number Atlanta residents who are enrolled in private schools (perhaps 75% of the total) are most likely to live in SRT 4. As many as 25% of all resident students within this SRT may attend private schools. This percentage is dramatically smaller elsewhere in the City. If private school enrollment has recently declined due to economic recession, then the effects should show up in the next round of private school enrollment reports to be submitted in late September. The resulting impacts of private school transfers (if any) are also most likely to be felt by APS schools located within SRT 4.

Demographic Factors Impacting APS Enrollment

9. The Atlanta Public Schools district's total fertility rates over the life of the forecasts are below replacement levels. (District TFR=1.78 vs. Replacement Level TFR=2.1) Lower fertility rates reflect the fact that the Baby Boom generation passed through prime childbearing ages by 2003, thereby reducing the overall proportion of the population having children. The remaining population in childbearing ages (women ages 15-45) will have fewer children during the out years of the forecast.

10. The primary factors causing the district's enrollment to grow at a slow rate is the reduced level of out-migration in the 0-10 and 30-45 year old age groups to the suburban areas and the continued steady in-migration of younger adults. It is uncertain whether slower out-migration is a solidifying trend or a consequence of economic recession, which could reverse if regional economic conditions improve.

11. Most in-migration to the district occurs in the 20-to-35 age groups. However, the size and age structure of the pool of potential in-migrants will change and the effects of the in-migration of families on population growth will be greatly offset by the continued steady growing out-migration of resident young adults as graduating seniors continue to leave the district.

12. Up to 70% of all births occur to women between the ages of 20 and 29. As the locally born 18-to-24 year old population continues to leave the district, going to college or moving to other urban areas, the number of women at risk of childbirth during the next decade will decline. Consequently, the small number of non college age women in the district in prime child bearing ages will keep the number of births declining at a modest rate.

Forecast Implications

APS enrollment forecasts certainly appear to be manageable from a facility planning and budgeting perspective. However, the combination of unusually uncertain market conditions, new information to be revealed by the decennial census and the temporary nature of forecasted growth, favors continued monitoring and caution when designing strategies to accommodate expected short-term and long-term change. The scope of this analysis did not address capacity constraints at existing schools or propose strategies to adapt facilities or school attendance areas to accommodate the forecasted number and grade-level composition of APS students. These factors are obvious next steps in evaluating and responding to the data presented in this report.

INTRODUCTION

By demographic principle, distinctions are made between projections and forecasts. A projection extrapolates the past (and present) into the future with little or no attempt to take into account any factors that may impact the extrapolation (e.g., changes in fertility rates, housing patterns or migration patterns) while a forecast results when a projection is modified by reasoning to take into account the aforementioned factors.

To maximize the use of this study as a planning tool, the ultimate goal is not simply to project the past into the future, but rather to assess various factors' impact on the future. The future population and enrollment growth of each school district is influenced by a variety of factors. Not all factors will influence the entire school district at the same level. Some may affect different areas at dissimilar magnitudes and rates causing changes at varying points of time within the same district. Forecaster's judgment based on a thorough and intimate study of the district has been used to modify the demographic trends and factors to more accurately predict likely changes. Therefore, strictly speaking, this study is a forecast, not a projection; and the amount of modification of the demographic trends varies between different areas of the district as well as within the timeframe of the forecast.

The calculation of population forecasts of any type, and particularly for smaller populations such as a school district or its attendance areas, realistic suppositions must be made as to what the future will bring in terms of age specific fertility rates and residents' demographic behavior at certain points of the life course. The demographic history of the school district and its interplay with the social and economic history of the area is the starting point and basis of most of these suppositions particularly on key factors such as the age structure of the area. The unique nature of each district's and attendance area's demographic composition and rate of change over time must be assessed and understood to be factors throughout the life of the forecast series. Moreover, no two populations, particularly at the school district and attendance area level, have exactly the same characteristics.

The manifest purpose of these forecasts is to ascertain the demographic factors that will ultimately influence the enrollment levels in the district's schools. There are of course, other non-demographic factors the affect enrollment levels over time. These factors include, by are not limited to, transfer policies within the district, student transfers to and from neighboring districts, placement of "special programs" within school facilities that may serve students from outside the attendance area, state or federal mandates that dictate the movement of students from one facility to another (No Child Left Behind is an excellent example of the factor), the development of charter schools in the district, the prevalence of home schooling in the area and the dynamics of local private schools.

Unless the district specifically requests the calculation of forecasts that reflect the effects of changes in these non-demographic factors, their influences are held constant for the life of the forecasts. Again, the main function of these forecasts is to determine what impact demographic changes will have on future enrollment. It is quite possible to calculate special "scenario" forecasts to measure the impact of school policy modifications as well as planned economic and financial changes. However, in this case the results of these population and enrollment forecast are meant to represent the most likely scenario for changes over the next 10 years in the district and its attendance areas.

The first part of the report will examine the assumptions made in calculating the population forecasts for the Atlanta Public Schools district. Since the results of the population forecasts drive the subsequent enrollment forecasts, the assumption listed in this section are paramount to understanding the area's demographic dynamics. The remainder of the report is an explanation and analysis of the district's population forecasts and how they will affect the district's grade level enrollment forecasts.

DATA

The data used for the forecasts come from a variety of sources. Enrollments by grade and attendance center were provided by the Atlanta Public Schools district for school years 2002-2003 to 2008-09. Birth and death data were obtained from the Georgia State Department of Health for the years 2000 through 2008. The net migration values were calculated using Internal Revenue Service migration reports for the years 2000 through 2008. The data used for the calculation of migration models came from the United States Bureau of the Census, 1995 to 2000, and the models were assigned using an economic-demographic system. The base age-sex population counts used are from the results of the

2000 Census.

Due to the methodological problems the Census Bureau is experiencing with their estimates derived from data using the American Community Survey, (particularly in areas with less that 60,000 population) the results of the ACS are not used in these forecasts. Given the sampling framework used by the Census Bureau, only 7,900 of the over 225,000 current households in the Atlanta Public Schools district would have been included. For comparison, 28,000 households in the district were included in the sample for the long form questionnaire in the 2000 Census.

To develop the population forecast models, past migration patterns, current age specific fertility patterns, the magnitude and dynamics of the gross migration, the age specific mortality trends, the distribution of the population by age and sex, the rate and type of existing housing unit sales, and future housing unit construction are considered to be primary variables. In addition, the change in household size relative to the age structure of the forecast area was addressed. While there was a substantial drop in the average household size in Atlanta as well as most other areas of the state during the previous 20 years, the rate of this decline has been forecasted to slow over the next ten years.

ASSUMPTIONS

For these forecasts, the mortality probabilities are held constant at the levels calculated for the year 2000. While the number of deaths in an area are impacted by and will change given the proportion of the local population over age 65, in the absence of an extraordinary event such as a natural disaster or a breakthrough in the treatment of heart disease, death rates rarely move rapidly in any direction, particularly at the school district or attendance area level. Thus, significant changes are not foreseen in district's mortality rates between now and the year 2019. Any increases forecasted in the number of deaths will be due primarily to the general ageing of the district's population and specifically to the increase in the number of residents aged 65 and older.

Similarly, fertility rates are assumed to stay fairly constant for the life of the forecasts. Like mortality rates, age specific fertility rates rarely change quickly or dramatically, particularly in small areas. Even with the recently report rise in the fertility rates of the United States, overall fertility rates have stayed within a 10% range for most of the last 40 years. In fact the vast majority of year to year change in an area's number of births is due to changes in the number of women in child bearing ages (particularly ages 20-29) rather than any fluctuation in an area's fertility rate.

The total fertility rate (TFR), the average number of births a woman will have in her lifetime, is estimated to be 1.78 for the total district for the ten years of the population forecasts. The age specific fertility rates are also held constant for all areas for the life of the projection. A TFR of 2.1 births per woman is considered to be the theoretical "replacement level" of fertility necessary for a population to remain constant in the absence of in-migration. Therefore, over the course of the forecast period, fertility will not be sufficient, in the absence of migration, to maintain the current level of population within the Atlanta Public Schools district.

A close examination of data for the Atlanta Public Schools district has shown the age specific pattern of net migration will be nearly constant throughout the life of the forecasts. While the number of in and out migrants has changed in past years for the district (and will change again over the next 10 years), the basic age pattern of the migrants has stayed nearly the same over the last 40 years. Based on the analysis of data it is safe to assume this age specific migration trend will remain unchanged into the future. This pattern of migration shows most of the local in-migration occurring in the 20-to-34 year old age group, as young adults move to the area to go to college or move from other urban areas. The second group of in-migrants is those householders aged 65 and older who are downsizing and moving to smaller homes (particularly from the outlying suburban areas). Most of the local out-migration occurs in the 0-to-10 and 25-to-40 age groups, primarily consisting of younger adults and their children moving into the suburbanized areas.

As the city of Atlanta and Fulton County are not currently contemplating any drastic changes to their inherent structures, the forecasts also assume the current economic, political, transportation and public works infrastructure (with a few notable exceptions), social, and environmental factors of the school district and its attendance areas will remain the same through the year 2018.

Below is a list of assumptions and issues that are specific to Fulton County and the Atlanta Public Schools district. These issues have been used to modify the population forecast models to more accurately predict the impact of these factors on each area's population change. Specifically, the forecasts for the Atlanta Public Schools district assume that throughout the study period:

a. There will be no short term economic recovery in the next 18 months and the national, state or regional economy does not go into deep recession at anytime during the 10 years of the forecasts; (Deep recession is defined as four consecutive quarters where the GDP contracts greater than 1% per quarter)

b. Interest rates have reached an historic low, and will not fluctuate more than one percentage point in the short term; the interest rate for a 30 year fixed home mortgage stays below 7%;

c. The rate of mortgage approval stays at 1999-2002 levels and lenders do not return to "sub-prime" mortgage practices.

d. There are no additional restrictions placed on home mortgages lenders or additional bankruptcies of major credit providers.

e. The rate of housing foreclosures does not exceed 125% of the 2005-2007 average of Atlanta for any year in the forecasts.

f. All currently planned, platted and approved housing developments are built out and completed by 2018. All housing units constructed are occupied by 2019.

g. The unemployment rates for the Atlanta Metropolitan Area will remain below 10.0% for the 10 years of the forecasts.

h. The rate of students transferring into and out of the Atlanta Public Schools district to other schools will remain at the 2005-06 to 2008-09 average.

i. The inflation rate for gasoline will stay below 5% per year for the 10 years of the forecasts.

j. There will be no building moratorium within the district;

k. Businesses within the district and the Greater Atlanta Metropolitan Area will remain viable;

l. The number of existing home sales in the school district that are a results of "distress sales" (homes worth less than the current mortgage value) will not exceed 20% of total homes sales in the district for any given year.

m. Housing turnover rates (sale of existing homes in the district) will remain at their current levels. The majority of existing home sales are made by home owners over the age of 55;

n. Private school and home school attendance rates will remain constant;

o. There are no additional charter schools opened in the city of Atlanta over the course of the forecast period.

If a major employer in the district or in the Greater Atlanta Metropolitan Area closes, reduces or expands its operations, the population forecasts would need to be adjusted to reflect the changes brought about by the change in economic and employment conditions. The same holds true for any type of natural disaster, major change in the local infrastructure (e.g., highway construction, water and sewer expansion, changes in zoning regulations etc.), a further economic downturn, any additional weakness in the housing market or any instance or situation that causes rapid and dramatic population changes that could not be foreseen at the time that the forecasts were calculated.

The large proportion of high school graduates from the Atlanta Public Schools district that continue on to college or move to urban areas outside of the district for employment is a significant demographic factor. Their departure is a major reason for the high out-migration in the locally born 18-to-24 age group and was taken into account when calculating these forecasts. The out-migration of graduating high school seniors is expected to continue over the period of the forecasts, and the rate of out-

migration has been forecasted to remain the same over the life of the forecast series. Given that the district will have progressively larger graduation classes over the next 10 years, (the class of 2019 should be approximately 16% larger than the class of 2009) the number of out migrants from the district will increase.

Finally, all demographic trends (i.e., births, deaths, and migration) are assumed to be linear in nature and annualized over the forecast period. For example, if 1,000 births are forecasted for a 5-year period, an equal number, or proportion of the births are assumed to occur every year, 200 per year. Actual year-to-year variations do and will occur, but overall year to year trends are expected to be constant.

METHODOLOGY

The population forecasts presented in this report are the result of using the Cohort-Component Method of population forecasting (Siegel, and Swanson, 2004: 561-601) (Smith et. al. 2004). As stated in the Introduction, the difference between a projection and a forecast is in the use of explicit judgment based upon the unique features of the area under study. Strictly speaking, a cohort-component projection refers to the future population that would result if a mathematical extrapolation of historical trends were applied to the components of change (i.e., births, deaths, and migration). Conversely, a cohort-component forecast refers to the future population that is expected because of a studied and purposeful selection of the components of change believed to be critical factors of influence in each specific area.

Five sets of data are required to generate population and enrollment forecasts. These five data sets are:

a. a base-year population (here, the 2000 Census population for the Atlanta Public Schools district and the attendance areas);

b. a set of age-specific fertility rates for each attendance area to be used over the forecast period;

c. a set of age-specific survival (mortality) rates for each attendance area;

d. a set of age-specific migration rates for each attendance area; and

e. the historical enrollment figures by grade.

The most significant and difficult aspect of producing enrollment forecasts is the generation of the population forecasts in which the school age population (and enrollment) is embedded. In turn, the most difficult aspect of generating the population forecasts is found in deriving the rates of change in fertility, mortality, and migration. From the standpoint of demographic analysis, the Atlanta Public Schools district and its fifty-five elementary attendance center districts are classified as "small area" populations (as compared to the population of the state of Georgia or to that of the United States). Small area population forecasts are more difficult to calculate because local variations in fertility, mortality, and migration may be more irregular than those at the state or national scale. Especially challenging to project are migration rates for local areas, because changes in the area's socioeconomic characteristics can quickly change from past and current patterns (Peters and Larkin, 2002.)

The population forecasts for Atlanta were calculated using a cohort-component method with the populations divided into male and female groups by five-year age cohorts that range from 0-to-4 years of age to 85 years of age and older (85+). Age- and sex-specific fertility, mortality, and migration models were constructed to specifically reflect the demographic characteristics of the Atlanta Public Schools district's attendance center districts and the total school district.

The enrollment forecasts were calculated using a modified average survivorship method. Average survivor rates (i.e., the proportion of students who progress from one grade level to the next given the average amount of net migration for that grade level) over the previous five years of year-to-year enrollment data were calculated for grades two through twelve.

The survivorship rates were modified, or adjusted, to reflect the average rate of forecasted in and out migration of 5-to-9, 10-to-14 and 15-to-17 year olds cohorts to each of the attendance centers in Atlanta for the period 2000 to 2005. These survivorship rates then were adjusted to reflect the forecasted changes in age-specific migration the district should experience over the next five years. These modified survivorship rates were used to project the enrollment of grades 2 through 12 for the period 2005 to

2010. The survivorship rates were adjusted again for the period 2010 to 2015 to reflect the predicted changes in the amount of age-specific migration in the districts for the period.

The forecasted enrollments for kindergarten and first grade are derived from the 5-to-9 year old population of the age-sex population forecast at the elementary attendance center district level. This procedure allows the changes in the incoming grade sizes to be factors of forecasted population change and not an extrapolation of previous class sizes. Given the potentially large amount of variation in Kindergarten enrollment due to parental choice, changes in the state's minimum age requirement, and differing district policies on allowing children to start Kindergarten early, first grade enrollment is deemed to be a more accurate and reliable starting point for the forecasts. (McKibben, 1996) The level of the accuracy for both the population and enrollment forecasts at the school district level is estimated to be +2.0% for the life of the forecasts.

RESULTS AND ANALYSIS OF THE POPULATION FORECASTS

From 2005 to 2015, the populations of the Atlanta Public Schools district, Fulton County, the state of Georgia, and the United States are forecasted to change as follows; the Atlanta Public Schools district will increase by 19.6%, Fulton County will grow by 19.1 %, Georgia will increase by 16.7%; and the United States rate of increase will be 11.1% (see Table 1).

Table 1: Forecasted Population Change, 2005 to 2015

	2005	2010	2015	10-Year Change
U.S. (in millions)	296	312	329	11.1%
Georgia	9,091,000	9,831,000	10,612,000	16.7%
Fulton County	927,600	1,008,900	1,104,800	19.1%
Atlanta School District	477,710	537,760	571,270	19.6%

A number of general demographic factors will influence the growth rate of the Atlanta Public Schools district during this period, and include the following:

a. The Baby Boom generation will have passed through prime childbearing ages by 2003, thereby reducing the overall proportion of the population at risk of having children;

b. The remaining population in childbearing ages (women ages 15-45) will have fewer children;

c. The locally born 18-to-24 year old population, in prime childbearing ages, will continue to leave the area to go to college or to other urban areas, with the magnitude of this out-migration flow slowly increasing; and,

d. The district will experience continued increase in housing stock, with an average of 1,000 new units being built each year through 2014. New housing construction will continue after that point, but housing starts will only average 750 per year until 2019.

The Atlanta Public Schools district will continue to experience significant in-migration (movement of new young families into the district) over the next 10 years. However, the size and age structure of the pool of potential in-migrants will change and the effects of the in-migration of families on population growth will be greatly offset by the continued steady growing out-migration of young adults as graduating seniors continue to leave the district.

From 2005 to 2010, the school district population is forecasted to increase by 60,050, or 12.6%, to 537,760. From 2010 to 2015, the population is forecasted to continue to increase by an additional 33,510 persons or 6.2%. During the ten years of the forecasts, all of the elementary attendance areas are forecasted to increase in population with the growth rates ranging from 4.7% in the E.L. Connally area to 42.9% in the Sarah Smith area (See Table 2 for population forecast results of each elementary attendance area). However it is important to note that all attendance areas will experience a decline in their growth rates after 2010.

While all elementary areas will see some amount of gross in-migration, (primarily in the 0-to-14 and 25-to-40 age groups,) all areas also will continue to see gross out-migration. This out-migration primarily will be young adults, 18-to-24 years old, as

locally born graduating seniors continue to leave the district to go to college or seek employment in larger urban areas. Consequently, all of the attendance areas will experience a modest reduction in their average household size.

As stated in the Assumptions and emphasized above, the impact of the high proportion of high school graduates that leave the district to continue on to college or to seek employment in large urban areas is significant to the size and structure of the future population of the district. Up to 70% of all births occur to women between the ages of 20 and 29. As the graduating seniors continue leave the district, the number of women at risk of childbirth during the next decade declines. Consequently, the small number of non college age women in the district in prime child bearing ages will keep the number of births declining at a modest rate despite the district having a growing population (see the population pyramids in the appendix of this report for a graphic representation of the age distributions of the district and all of the attendance areas). This will require the district to become quite dependant on the in-migration of children just to maintain current age cohort sizes, let alone experience pop growth rates similar to those seen the last 10 years.

As a general rule of thumb, for every two seniors that leave the district, one new household must move into the district to replace the young adults that have left and to replace their lost potential fertility. Over the course of the forecast period, the average number of graduating seniors will be approximately 2600 per year and at least two-thirds of them will move out of the district within three years of graduation. Using the general rule, approximately 870 new families will be required to move into the district every year or 8,700 new families for the ten-year study period to replace the graduating seniors and their lost fertility. It is forecasted that the impact of the steadily increasing out-migration of young adults will continue to be mostly, (but not completely) offset by the reduction of young family (25-40 year old householders) out-migration to the suburban areas and that the total number of births will be remain fairly constant throughout most of the forecast period.

Another factor that needs to be considered is the birth dynamics of the last twenty years. An examination of national birth trends shows there was a large "Baby Boomlet" born between 1980 and 1995. This Boomlet was nearly as large as the Baby Boom of the 1950s and 1960s. However, unlike the Baby Boom, the Boomlet was a regional and not a national phenomenon (McKibben, et. al. 1999). Because Georgia experienced only a modest Baby Boomlet, most of the expected enrollment growth will have to result from in-migration and not from an increase in the grade cohort size.

Clearly, the dominant factor that has affected the population growth rates of the school district over the last 20 years has been the number, pace and cost of new homes constructed. However, the dynamics of this in migration flow are more complex than many realize. There is a common misconception that any changes in the economy, housing market or transportation system will an immediate impact of the size of an area's population and the total impact of that change will be experiences immediately. For example, the Atlanta Public Schools district had been experiencing and averaging over 8,000 new housing units constructed per year from 2001 to 2006. From 2007 to 2009 the area has been averaging about 2,500 new housing units per year.

This "delayed demographic reaction" is a key issue when attempting to ascertain the impact and duration of a trend. While it is true that the households moving into these new housing units bring many school age (particularly elementary) children into the district, they also bring many preschool age children as well. Consequently, the full impact of the growth in new home construction is not seen immediately in elementary enrollment as it takes three to seven years for all of the children to age into the schools. This is a key issue since the number of births in the school district is insufficient to maintain current enrollment levels. The number of non-college women living in the district ages 20-29 (prime child bearing ages) is too small to produce birth cohorts that are the same size as those currently in the elementary grades.

Of additional concern are the issues of the district's aging population and the growing number of "empty nest" households, particularly in the Capital View and Cleveland Avenue attendance areas. For example, after the last school age child leaves high school, the household becomes an "empty nest" and most likely will not send any more children to the school system. In most cases, it takes 20 to 30 years before all original (or first time) occupants of a housing area move out and are replaced by new, young families with children. This principle also applies to children leaving elementary school and moving on the middle school. Households can still have school age children in the district's school, but also in effect be "empty nest" of elementary age children.

Note as well the steady increase in the median age of the population in the district and all of its

attendance areas (see population forecasts in the appendix for the median age for each forecast year). The Atlanta Public Schools district as a whole will see the median age of its population increase from 32.4 in 2005 to 37.1 in 2020. This rise in median age is due to two factors, 18-24 years leaving the district and a high proportion of their parents staying in their existing households.

As a result of the "empty nest" syndrome, the attendance areas in the Atlanta Public Schools district will see a steady rise in the median age of their populations, even while the district as a whole continues to attract some new young families. It should be noted that many of these "childless" households are single persons and/or elderly. Consequently, even if many of these housing units "turnover" and attract households of similar characteristics, they will add little to the number of school age children in the district. Furthermore, many of the empty nest households will "down size" to smaller households within the district. In these cases new housing units may be built in an area, yet there is no corresponding increase in school enrollment.

There are several additional factors that are responsible for the difference between growth in population and growth in housing stock. Included among these factors are: people building new "move up" homes in the same area or district, (an important point since the children in move up homes tend to be of middle or high school age); children moving out of their parents homes and establishing residence in the same area; the increase in single-individual households; and divorce, with both parents remaining in the same area.

RESULTS AND ANALYSIS OF ENROLLMENT FORECASTS

Elementary Enrollment

The total elementary enrollment of the district is forecasted to decrease from 24,622 in 2009 to 23,722 in 2014, a drop of 900 students or -3.7%. From 2014 to 2019, elementary enrollment is expected to decline by 1,233 students to 22,489. This would represent a -5.2% decrease over the five-year period. Nine of the 55 elementary attendance areas will experience a net increase in enrollment over the next ten years.

However, examining the amount of enrollment change over the 10 year period tends to mask a significant amount of variation in the enrollment trends during this time span. From 2009 to 2014, 17 attendance areas will see a net increase in student. After 2014 only six of the elementary attendance areas show a net increase in students for the period 2014 to 2019.

The reason for this dramatic turnaround in elementary enrollment pattern (and a marked departure from the elementary trends the district has been experiencing over the last 10 years) is the convergence of the effects of three factors, all occurring roughly in the 2010-2015 time period. These factors

are the equalization of cohort sizes in the elementary grades, the number of housing units turning over and the slowing of the rise in the number of empty nest households. Each of these factors will contribute in part to the growth in elementary enrollment until 2012 and subsequent decline afterwards.

Over the last several years, one of the main reason elementary enrollment was increasing was due to the fact that the number of children entering Kindergarten and 1st grade was much larger than the number leaving elementary school after completing 5th grade. After 2009, the number of students in 5th grade will be over 3,730 each year as opposed to the 3,400 average the district experienced over the last five years. Thus even if the rate of population growth continued at the same pace as the 2000-2005 period, the rate of elementary enrollment growth would have slowed down as the number of students leaving grade 5 increases each year.

The second factor is the slow-down in the housing construction industry. While it is true that the Atlanta Metropolitan Area housing market has done somewhat better than the national trends the last 3 years, it is not immune the effects of a tightening of the mortgage market and in increasingly restrictive lending practices. Atlanta, like most areas of the county saw the number of new and existing home sales jump significantly in 2001 to 2006 as the expansion of sub-prime mortgage practices allowed many people to purchase new homes. Given the turmoil the collapse of the sub-prime market has caused, it can be assumed that there will not be a return to these lending practices anytime in the near future.

Consequently, the Atlanta Public Schools district (like most urban areas in the country) will see the number of new homes sales drop back to the levels experienced before the sub-prime boom. This trend was already evident in 2007 through 2009. Further, these forecasts assume that there will not be a significant increase in the number of foreclosed housing units being put on the market in the immediate future.

The third factor is the rise of the number of empty nest households in the district. In 2000 the school district had 38.5% of their households headed by people ages 35-54 (The ages most people have school aged children). The district's proportion of households in these age groups has dropped slightly over the last eight years as people aged and the households became empty nest. Unfortunately, the large bubble of now empty nest households, (particularity empty of elementary age students) will not reach their 70s during the life of these forecasts. It is at this stage of life when most households downsize, and new young families move in.

The demographic factors that will become the most influential over the next ten years are the growth rate of empty nest household in the attendance areas, the number of sales of new homes, the rate and magnitude of existing housing unit "turn over," the relative size of the elementary and pre-school age cohorts and each area's fertility rate. Each of these factors will vary in the scale of their influence and timing of impact on the enrollment trends of any particular elementary area.

Table 5: Single Person Household and Single Person Households Over Age 65 by Elementary Districts, 2000 Census

Attendance areas that are currently experiencing a rise in empty nest households tend to be the same areas that are not the recipients of any large sustained new housing construction. Thus, areas like Heritage and Kimberly will see net declines in elementary enrollment. While these areas will continue to see net in migration of families, it will not be at a sufficient rate to maintain current attendance levels.

As more elementary attendance areas become completely dependent upon existing home sales to attract new families, the overall elementary enrollment trend of the district will decline. Areas such as E. Rivers and M. A. Jones will see their elementary enrollments peak by the middle of the decade and then slowly decline. Thus, the best primary short- and long-term indicator for enrollment change in most of the attendance area will be the year-to-year rate of housing turnover. If the Total Fertility Rates of all the attendance areas remain at their current low levels (and they are forecasted to do so) they will insure that enrollments will continue to see slowing growth (or outright declines) even if the level of net out-migration is greatly reduced.

It is important to note that not all new housing construction results in an increase in elementary enrollment. Frequently in cases where the new home construction is primarily move up houses (priced $417,000 or higher, the lower limits of a jumbo mortgage until 2008) the impact on enrollment is felt more at the middle and high school levels than at the elementary level. These homes are usually purchased by families who have completed their childbearing and the children they do have tend to be ages 10 and older.

Yet, equally important are the factors of housing turn-over and "family formation." Areas with existing homes that have a large proportion of housing units owned by their residents and have a large proportion of their homeowners age 65 or older are prime candidates to experience a growing amount of housing turn-over. In the Atlanta Public Schools district, an area such as Beecher Hills, West Manor and R. N. Fickett are an excellent example of this trend. These areas, which would normally see a dramatic drop in their enrollment numbers as the number of households with school age children decline, will see moderate changes and long term stability in their student populations as young families move into formerly empty nest housing units.

Additionally, there are areas that are characterized by the relatively high percentage of rental housing units and large concentrations of young adults. In these

Total	**24,622**	**23,722**	-3.7%	**22,489**	-5.2%	**-8.7%**

cases, young adults or the newly married, move to these areas and establish households. Because the population is in prime child bearing ages, these areas also have both a high absolute number of births and a higher than the district average birth rate. Later, as family size increases, these families often move to single family homes--usually moderately priced single family homes in other parts of the school district.

Consequently, attendance areas with characteristics like Margaret Fain, Paul Dunbar and Centennial Place serve as feeder areas for outlying attendance areas in the district. This internal migration flow is far more important in determining future enrollment trends than the construction of new single family homes since an average of six existing homes are sold for every new home built. Indeed, a close examination of the year to year trends in the family formation areas will serve as an excellent bellwether for short and medium term changes in areas that depend on in-migration for enrollment growth.

Middle School Enrollment

The total middle school enrollment for the district is forecasted to grow from 8,987 in 2009 to 9,713 in 2014, a 726 student or 8.1% increase. Between 2014 and 2019 middle school enrollment is forecasted to grow to 9,840, an increase of 127 students or 1.3%. The difference in the size of the individual grade cohorts and the aging of students through the school system are the primary reasons why the middle school enrollment trends deviate from those of the elementary grades.

Table 7: Total Middle School Enrollment, 2009, 2014, 2019

There are currently large grade cohorts enrolled in the elementary school grades compared to those in the middle schools' grade cohorts. As these elementary school cohorts "age" into middle school and smaller middle school cohorts age into high school, they increase the overall middle school enrollment level. Note how the size of the incoming 6th grade class is usually larger than the previous year's 8th grade class, which has now moved on the high school. As long as this "bubble" in the enrollment pattern exists, there will be to some degree, an increase in middle school enrollment, at least until the 2013-2014 school year.

After the 2013-2014 school year, this cohort trend reverses. There will then be smaller grade cohorts entering the middle school grades compared to those leaving. The result is a moderation of middle school enrollment until 2019. This trend will most likely continue beyond the end of the forecasts series ending sometime after 2020.

A secondary, but equally important factor is the large number of "move up" homes being built in the district. These homes, selling in excess of $417,000 tend to have children in the late elementary and middle school ages. Thus, the effect on enrollment from a new housing development with these types of homes would be first seen at grades five through eight. However, as the number of move up home being constructed in the district declines over the next 10 years, the impact of in-migration will be reduced regarding year to year middle school enrollment trends.

These enrollment trends will not be consistent between the various middle school attendance areas. Parks Middle School will see an enrollment pattern that shows somewhat weaker enrollment growth the overall district middle school enrollment trends. There is some enrollment growth in its elementary feeder area, but not to the same level as the district average. As this growth bubble enters middle school enrollments will rise, but will begin to level off after 2013.

The Sutton Middle School will experience an increase in students in a much greater magnitude than the district average. This area has large elementary grade cohorts aging into the middle school that will continue until the middle of the next decade. Consequently, Sutton Middle School will see an immediate increase in enrollment due to the building of higher priced homes

and then subsequently see its enrollment continue to increase as the children in the young family home age through the school system. However, beginning in 2013 Sutton will begin to have much larger exiting 8th grade. The will results in the entering and leaving cohorts becoming roughly the same size and the amount of total middle school enrollment at the school will begin to stabilize.

High School Enrollment

Enrollment at the high school level is forecasted to increase from 11,889 in 2009 to 13,333 in 2014, an increase of 1,444 students or 12.1%. After 2014, the high school enrollment will continue to increase much at a much slower rate. The net result for the five-year period 2014-to-2019 will be an increase of 709 students to 14,042 or 5.3%.

The aforementioned effects of changes in cohort size on middle school enrollment are also affecting the growth patterns of the high school population. The difference here is that the current grade cohorts in both the middle school and elementary schools are larger than those currently in the high school grades. Thus, the increase in high school enrollment will continue for approximately eight years.

After 2010, the larger grade cohorts that are the middle school enrollment begin to enter high school. Until this bubble of students (and the students that are now in the elementary grades) passes through the high school grades, there will be continued growth at the high school level. The main difference is that the growth in the high school enrollment will continue throughout most of the life of the forecasts, peaking sometime around the year 2019.

It is important to note that the vast majority of this future high school enrollment growth will be a result of students aging into those grades. Specifically, students who already live in the district (and not in-migration of students ages 14 to 18) will be the primary cause of the forecasted increase in high school enrollment. Additionally, as was mentioned early, these forecasts represent the demographic changes that will affect high school enrollment. Any changes in the district's student transfer policy will need to be added or subtracted from the forecast result.

Table 8: Total High School Enrollment, 2009, 2014, 2019

HS Attendance Area	2009	2014	2009-2014 Change	2019	2014-2019 Change	2009-2019 Change

Grady HS	1,481	1,498	1.1%	1,574	5.1%	6.3%
Douglas HS	1,384	1,169	-15.5%	1,222	4.5%	-11.7%
North Atlanta HS	1,129	1,726	52.9%	1,907	10.5%	68.9%
Total High School	**11,889**	**13,333**	12.1%	**14,042**	5.3%	**18.1%**

High school enrollment is the most difficult of all the grade levels to project. The reason for this is the varying and constantly changing dropout rates, particularly in grades 10 and 11. For these forecasts the dropout rates at the high school were calculated for each grade over the last five years. These five-year averages were then held constant for the life of the forecast. The effects of any policy changes dealing with any school's drop-out rates, program placement or reassignment of former students to new grade levels will need to be added or subtracted from the forecast results.

As was the case in the middle schools, the rate and magnitude of enrollment changes will vary greatly from high school to high school. The elementary and middle schools that feed into Mays High School do not currently have large student cohorts compared to those that are now in the high school grades. Consequently, Mays High School will experience a relatively stable enrollment pattern over the next 10 years.

Conversely, North Atlanta High School has very large grade cohorts in its elementary and middle school feeders areas compared to those currently at the high school. Thus this school will experience substantial and sustained enrollment growth at least until the 2016-2017 school year. Because of these large grade cohorts in its feeders schools, North Atlanta High School will see at least a 60% growth in enrollment over the next 10 years even if the current downturn in the new and existing housing market continues until 2020.

PRIVATE SCHOOL AND HOME SCHOOL TRENDS

I. INTRODUCTION

The following appendix profiles recent trends in private and home school enrollment among resident students living in the Atlanta Public School District (APS). This analysis was prepared by Bleakly Advisory Group, Inc. (BAG) to supplement a more comprehensive demographic study and enrollment forecast for APS. The demographic study was prepared by a consultant team that includes McKibben Demographic Research, Cropper GIS and BAG.

During the 2009-10 school year nearly 6,300 Atlanta residents were identified as either enrolled in private schools or classified as home study/home schooled students by the Georgia Department of Education (DOE). This estimate represents 11.4% of the nearly 55,000 Atlanta resident school-aged children who were enrolled in public, private or home schools during the past year. Both the total number and the percentage of private/home schooled students in Atlanta are clearly important in terms of their impact on APS enrollment and significant future changes to private and/or home school participation among City residents could obviously affect APS enrollment projections. Because participation in private education is not evenly distributed throughout the City, certain SRT's, school attendance areas and individual schools could be much more influenced by changes in private education than the APS as a whole.

The purpose of this analysis is to examine private and home study data in more detail in order to answer the following questions:

- Is APS significantly different from other Georgia school districts in terms of the percentage of resident students who are educated privately?
- Has participation in private education among Atlanta residents been increasing, decreasing or remained stable in recent years?
- Has there been any noticeable change in the enrollment patterns of Atlanta residents among individual private schools?
- What parts of the City have the largest numbers of private or home schooled students?
- Is there a realistic prospect that economic conditions or other factors could significantly alter the number and/or percentage of Atlanta students who receive a private education?
- Which APS schools, if any, could be most affected by potential changes in private school enrollment?

The following sections address these questions using the best available data obtained from APS and Georgia DOE records, private school directories and related sources. Private and home school enrollment records have only been consistently collected and retained over the past five to six years and the reporting of such data is the responsibility of individual private schools. State regulations require private schools to report the place of residence of their students to the affected public school districts within 30 days after the start of the school year. However, APS has no means of verifying whether all private schools with Atlanta resident students or all households with home schooled children actually comply with these regulations.

Our examination of individual records suggests that reporting compliance among private schools may have improved in recent years, which has resulted in an increasing total count of private school enrollment. In some cases it is difficult to determine whether higher enrollment figures represent actual growth or simply reflect better reporting. Nearly all of these past reports have been submitted in paper form, making it more difficult for APS to collect, organize and retain numerous individual records dating back several years. Therefore, it is possible that estimates for prior years could be influenced by lost records as well as more sporadic reporting practices among private schools.

Finally, the tracking of Atlanta resident children who are not enrolled in APS is complicated by the sheer number of private educational institutions that operate in the City and in nearby suburbs. While most school districts typically contain only a handful of private schools, a total of 76 different schools reported enrolling at least one Atlanta resident last year. Since 2004, 113 different private institutions have reported enrolling Atlanta residents during one or more years. Private schools are only required to report to those public school districts where enrolled students actually live. Therefore, APS cannot verify whether reporting gaps by individual private schools indicate that those schools enrolled no Atlanta residents during years when no reports were submitted. In some cases it is more likely that missing data means that the private school simply didn't report enrollment for that particular year.

Recognizing the inherent limitations of the data, the following sections summarize the findings from BAG's review of private and home study enrollment.

II. DETAILED FINDINGS

A. Comparative Context – Private School Enrollment

With a reported March 2010 Full Time Equivalent (FTE) enrollment of 48,696, APS is the sixth largest school district in Georgia based on total students. The estimated 5,830 Atlanta resident students enrolled in private schools (in September of 2009) is also the sixth largest number among all Georgia school districts. Residents of the Fulton County School District had the largest number of residents enrolled in private schools with 10,884, followed by Cobb (8,262), Gwinnett (8,016), DeKalb (7,949) and Chatham County (6,423). It is not surprising that the State's larger school districts would also have the greatest availability of private school options and therefore the largest number of students enrolled in private schools. As a proportion of total students participating in public, private or home study programs, 10.6% of APS student population was enrolled in private schools last year. Among Georgia's 37 school districts which have 10,000 or more students, APS' percentage of private school attendees to total student population was the fifth highest in the State. Chatham County had the highest proportion of private school students at 15.5% of its total resident enrollment, followed by Clarke County (14.2%), Bibb County (13.3%) and Fulton County (10.6%).

To place private school enrollment in Atlanta in the context of surrounding school districts, BAG compared APS to public school districts which are located within Metro-Atlanta's "10 Core Counties" as defined by the Atlanta Regional Commission. We collected data and compared APS to the 10 county districts and two other city school districts in Marietta and Decatur. The percentage of total school population enrolled in private schools within each of these 13 school districts is exhibited in Figure 1.

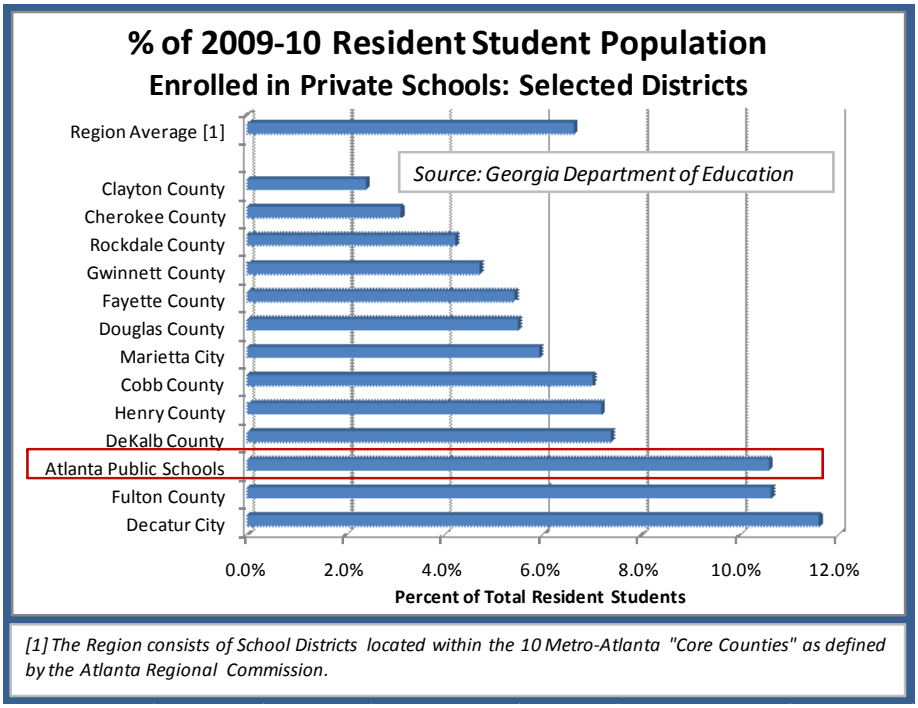

Figure 1

Throughout the 10 core counties more than 51,100 students were enrolled in private schools last year, representing 7.1% of the more than 770,800 total students living in the region. More than 11 percent of the 10-County region's private school enrollment is comprised of Atlanta residents. Among individual school districts, the percentage of students enrolled in private schools ranged from a high of 11.6% in Decatur to a low of 2.4% in Clayton County. Surprisingly, the State's largest school district, Gwinnett County, has a comparatively small percentage of private school students (4.7%) as do Clayton, Cherokee and Rockdale Counties.

B. Comparative Context – Home School/Home Study Enrollment

In contrast to the more than 5,800 resident students who are enrolled in private schools, APS contains a relatively small number of residents who are either home schooled or participate in home study programs. According to Georgia DOE data, only 268 Atlanta households registered home study students during the 2009-10 school year, educating an estimated 463 resident students. That total ranked 23rd among all school districts in Georgia. Gwinnett (3,367), Cobb (2,948) and Cherokee (2,320) Counties ranked one through three statewide in the number of resident students who are either home schooled or participate in home study programs. APS also had a very small percentage of resident participation in such programs at only 0.8%. Among all Georgia school districts with more than 10,000 students, APS ranked 36 out of 37 on that measure. Cherokee County had the largest percentage participation at 5.6% of total enrollment.

Throughout the 10 Metro-Atlanta core counties, more than 15,800 students were home schooled or participated in home study during the last school year, representing 2.1% of all students living in the region. Only 2.9 percent of the 10-County region's combined home schooled enrollment consisted of Atlanta residents. As a proportion of total resident students, APS was also last in terms of the percentage enrolled various forms of home study. Home study programs educated the largest percentage of resident students in Cherokee (5.6%), Fayette (3.5%) and Douglas (3.1%) County. Aside from Atlanta, home education was least common in Clayton (1.0%), Fulton (1.2%), DeKalb (1.3%) and the Decatur City School District (1.3%). Percentage participation in home study programs among nearby school districts is illustrated in Figure 2.

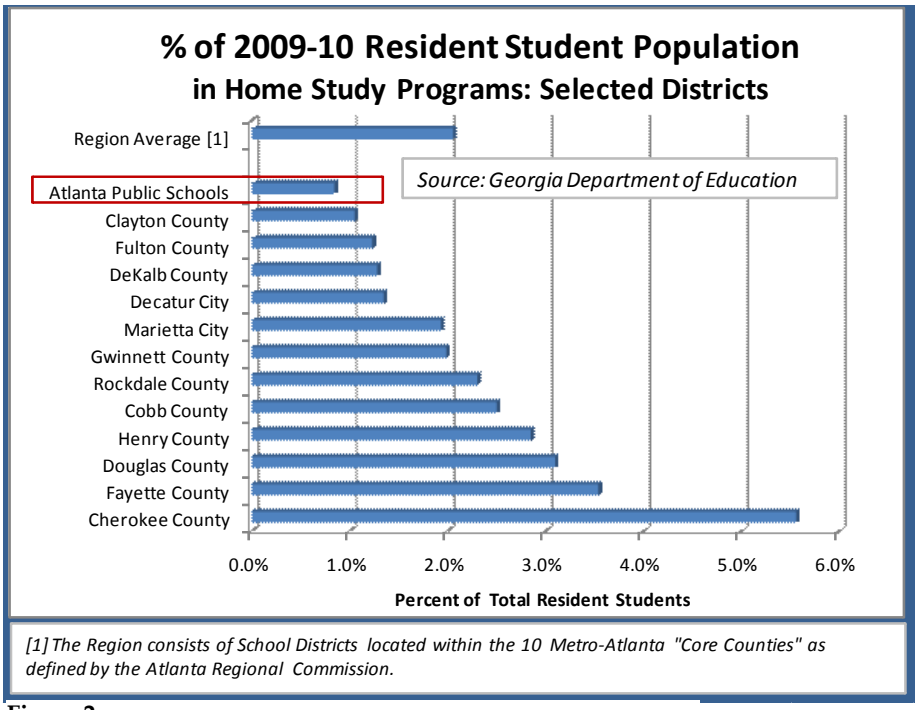

Figure 2

C. Comparative Context – Total Private Enrollment

Figure 3 expresses combined enrollment in either private schools or home study programs as a percentage of total resident student population. Nearly 147,700 or 8.2% of Georgia's 1.8 million resident students were educated outside of public school settings last year. Among the 13 school districts shown in Figure 3, 8.7% of all resident students are enrolled in either private schools or home study programs, similar to the statewide average. Percentages among individual school districts range from a low of 3.5% in Clayton County to a high of 13.0% in Decatur. APS is toward the upper end of this range at 11.4%, similar to Fulton (11.9%) and Henry County (10.0%).

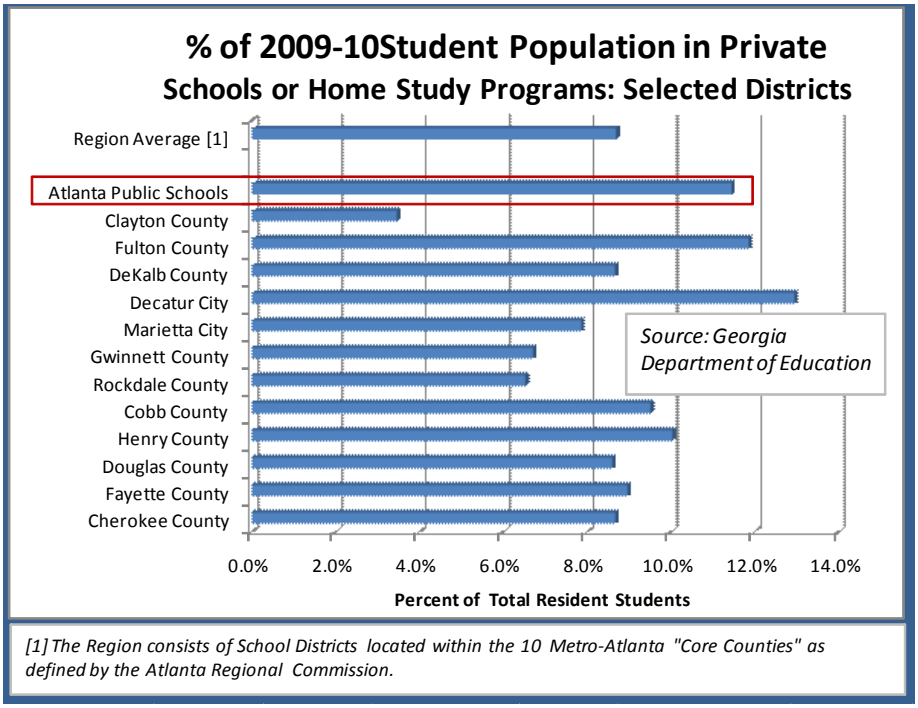

Figure 3

In comparing these exhibits it appears that in most school districts, local participation in home study programs is inversely proportional to the availability of private schools. (A noticeable exception is Clayton County, which showed limited percentages of both private and home study enrollment.) For the vast majority of Georgia school districts, the proportion of resident children who are educated outside of public school settings falls within a range of 6% to 12% of the total student population. Figure 3 thus shows that APS is not substantially different from surrounding school districts or the

statewide average in that respect. While APS is toward the upper end of the 6% to 12% range, it is consistent with comparable public school districts which are located in urban areas or serve college communities with numerous private school options.

D. Locations and Characteristics of Private Schools

A January 2010 Special Section "Education Guide" published with the Atlanta Business Chronicle contained a comprehensive listing of public and private schools located within the 10 County Metro Area. From that list, BAG identified 130 private schools that are located within the City of Atlanta or in nearby communities which are close enough to serve Atlanta residents. The list of these schools is attached to the end of this appendix and the locations of a number of them are identified in the accompanying maps. Among the 103 of these 130 private schools who reported enrollment to the Atlanta Business Chronicle, total enrollment exceeded 45,500 students.

BAG also obtained reports from APS and the Georgia DOE, which list all individual private schools which reported enrolling Atlanta residents at the start of the 2009-10 school year. The reports list the individual schools, their location (city mailing address), grades taught and the number of Atlanta students enrolled. As noted above, this list includes 76 different schools which reported enrolling a total of 5,830 Atlanta resident students last year.

With the assistance of Cropper GIS, BAG identified the locations of all 76 of these private schools and distinguished between those schools which are physically located within the boundaries of the APS District and those which are located outside of the City limits. Unfortunately the annual reporting by private schools does not include the grade levels or home address of Atlanta students. Therefore, it is impossible to precisely allocate Atlanta's private school population among the four SRTs or to individual school attendance areas within the SRTs. For those private schools located inside the City limits, BAG identified both the SRT and the School Attendance Area where the private school is located. For private schools located outside of the Atlanta City limits, we identified the SRT where Atlanta students are most likely to be drawn based on proximity. For some private schools which are located just beyond the City limits, we also identified the individual School Attendance Area that was closest to the private school location. In a few cases, the private school was too distant from the City to make any assumption concerning where Atlanta students may live. (These more remote schools tended to serve students with specialized needs or provide boarding.)

Tables 1 and 2 on the following pages list the individual private schools, their total and Atlanta resident enrollment, plus the SRTs and School Attendance Areas which are most likely to be influenced by those schools based on proximity. In all but a few cases where total enrollment figures could not be obtained, BAG also calculated the percentage of enrollment in each school that is represented by Atlanta residents.

Table 1 lists 26 private schools which are physically located within the Atlanta City Limits. These schools serve more than 12,500 students of which, roughly 4,100 or 32.7%are Atlanta residents. The majority of these schools (14) are located inside SRT 4. These same schools attract the largest number of Atlanta students (nearly 3,400) and have the highest percentage of Atlanta students, nearly 36% of total enrollment. SRT 3 has the next highest number of five private schools which enroll nearly 2,200 total students and serve 561 Atlanta residents (25.7%). SRT 1 contains six relatively small schools that serve 760 students but only 118 Atlanta residents (15.5%) and SRT 2 has only one private school. Containing a total of seven private schools, including the four largest in the City, the Warren T. Jackson Attendance Area probably contains the largest number of Atlanta resident students who attend private schools.

		TOTALS		**12,536**	**4,104**	**32.7%**			
		SRT 1		760	118	15.5%			
		SRT 2		98	33	33.7%			
		SRT 3		2,181	561	25.7%			
		SRT 4		9,497	3,392	35.7%			

As is also shown in the table, despite being physically based in the City, the majority of the 26 schools draw less than half of their students from Atlanta. Only six schools (Lovett, Pace Academy, Westminster, Galloway, Atlanta International and Padeia) account for nearly 69% of all Atlanta resident students served. The Lovett School enrolls the largest number of City residents (749) among all private schools, while Pace Academy draws the largest percentage of its total enrollment from Atlanta (58.1%).

Table 2 on the following page provides a similar listing of 45 private schools that are not located in the City but enroll more than 22,400 students, including roughly 1,700 Atlanta residents. In terms of total enrollment and geographic distribution, the largest percentage of those schools is located in North Fulton County, followed by DeKalb County, South Fulton, Cobb County and other scattered locations.

The vast majority of these schools are too distant from the City to impact a single School Attendance Area, although several are located very near the City limits and could have concentrated impacts. Based on the general locations of these schools, 27 of the 45 are likely to attract the bulk of their Atlanta students from SRT 4. These schools serve a total of more than 13,750 students and enrolled 951 Atlanta students (6.9%) last year. Another 12 schools located to the southwest of the City contain a total enrollment of nearly 6,200, including 638 Atlanta students (10.3%). Schools located in DeKalb County to the east of SRT 3 educate 843 students including 121 Atlanta residents (14.4%) and SRT 2 had only one nearby school (in Hapeville) that enrolled only 13 Atlanta students.

Although it is possible that some Atlanta residents travel considerable distances to attend private schools, it is likely that private schools located outside of the City draw the majority of their Atlanta students from the nearest SRT. For private schools located outside of the City, allocating the geographic distribution of Atlanta students based on proximity provides a reasonably accurate

distribution among the SRTs. Based on the number and locations of private schools located within and outside the City, BAG estimates that roughly 4,300 of the estimated 5,830 Atlanta residents who attend private schools are most likely to reside in SRT 4. It is therefore possible that residents of SRT 4 make up nearly 75%of all Atlanta students who attend private schools. Private schools would have a much smaller influence on residents living in SRTs 1 and 3, perhaps drawing as many as 1,400 students (combined) from those two areas. By comparison, SRT 2 appears to have limited access to private education and is likely to contain only 1% to 2% of all City residents who attended private schools last year.

Enrollment estimates and forecasts contained in the full demographic study indicate that 2009-2010 APS enrollment within SRT 4 was just below 12,900. If it is accurate that approximately 4,300 resident students in SRT 4 enrolled in private schools, then roughly 25% of the 17,200 students who may live in that SRT attended private schools last year. The next highest percentage of private school attendance to total school population exists in SRT 3 at 6.7%, followed by SRT 1 at 4.9%. Using the same methodology, the number of Atlanta private school students living in SRT 2 may be fewer than 50 and represent only 0.5% of the nearly 8,700 students who live in that section of the City. This information is summarized in Table 3.

Table 2:
Private Schools Located Outside the City of Atlanta that Enroll Atlanta Residents

TOTALS:	45,498	5,833	51,331	11.4%

NOTES:
[1] Totals exclude participants in home study/home school programs.
[2] Private enrollment for each SRT is estimated based on proximity of private schools to each SRT. Data is insufficient to identify private school students by address.
[3] Estimated 2009-10 enrollment estimates by SRT are not equivalent to March 2010 FTE enrollment as reported to the Georgia Department of Education.

While APS receives and maintains address information and telephone numbers for households with home schooled students, the scope of this analysis did not include geocoding enrollment. However, BAG did review prior year reports in which APS noted the School Attendance Area of each home schooled student. From those notations it appears that home school activity was widely dispersed and not concentrated in any particular area of the City. In most cases the number of home school participants within individual School Attendance Areas was fewer than ten and no individual area appeared to have a noticeably large or disproportionate number. Because home school attendees represent less than 1% of total enrollment within the APS and the numbers are geographically dispersed, BAG did not attempt to allocate 2009-10 enrollment to individual SRTs. Starting from such a small and scattered base, it is very unlikely that existing home schooling patterns could change significantly enough to have a noticeable impact on APS enrollment or the capacity of individual schools.

E. Individual Private School Attendance

Table 4 provides Atlanta resident enrollment history for 23 private schools which enrolled a minimum of 50 Atlanta residents at the start of the 2009-10 school year. In addition to listing the reported number of Atlanta resident enrolled at each school since 2005-06, this table calculates the average Atlanta enrollment over the past three years, the recent rate of enrollment growth or decline among Atlanta residents and the recent percentage of total enrollment that is made up of Atlanta residents. This sample of 23 schools has accounted for between 85% and 89% of all Atlanta residents who have attended private schools over the past five years. The following important observations were drawn from Table 4:

Table 4

Enrollment Trends Among Atlanta Resident Students Enrolled in Private Schools: (Minimum of 50 Resident Students)

NOTES:

[1]Total estimated 2009-10 enrollment as reported by the Atlanta Business Chronicle or other eliable secondary sources.

[2]Missing entries are assumed to mean that no Atlanta residents were enrolled in thosse schools in those years.

[3]Represents the average number of Atlanta residents enrolled and rate of enrollment growth at each school during the past three completed school years.

[4]Annual growth rates are calculated from the earliest data point provided (in most cases over 5 years).

[5]This column estimates the average percentage of total private school enrollment represented by Atlanta residents since the 2007-08 school year.

- Total reported private school enrollment among Atlanta resident students (all schools) has increased at a 80.% annual rate over the past three years, while enrollment at these 25 schools has increased at a 8.3% annual rate.

- Atlanta residents make up a significant percentage of the total enrollment capacity at these 25 schools, accounting for an average of 25% of all students over the past three years. The percentage of Atlanta residents attending these schools ranges from a low of 5% at the Marist School to high of more than 49% at Pace Academy.

- There has been a substantial variation in the rate of enrollment change among Atlanta residents at these schools over the past three years. Annual growth rates range from a high of more than 57% at the Heritage Preparatory School to a -9.0% annual decline at Pius X Catholic High School. Seventeen schools increased enrollment among Atlanta residents, seven lost enrollment and one reported no change over the period.

- Roughly half of all Atlanta- resident private school students attend six schools listed at the top of Table 4 (Lovett, Pace Academy, Westminster, Atlanta International, Galloway and Woodward Academy). These six schools alone enrolled nearly 2,900 Atlanta Students in 2009 and added 760 Atlanta residents (a 36% increase) over the previous five years. The remaining half of Atlanta's private school enrollment is scattered among 70 different private schools.

Although anecdotal evidence suggests that private enrollment may have decreased more recently due to economic recession, there was little evidence of that trend when the latest private school enrollment reports were submitted to APS in September of 2009. It is possible that the numbers shown in Table 4 may have decreased somewhat in recent months and impacts will show up when the new reports are submitted in late September. However, it is doubtful that private school enrollment declines will have a significant impact on total APS enrollment. Due to the concentration of private schools in SRT 4, any reductions in private school enrollment are more likely to be felt there and may disproportionally impact a small number of schools. It is recommended that APS play close attention to the 2010-11 reports to determine whether trends reported in Table 4 have changed significantly over the past 12 months.

LIVE ATTEND ANALYSIS

This map series focuses on illustrating the geographic distribution of Atlanta Public School 2009-10 students in relation to school attendance boundaries.

Here is an example of a map from this series.

Basic Map Elements

The legend depicts how different features are represented, either by a point (e.g. school or student), line (e.g. road), or area/polygon (e.g. attendance boundary). The scale bar references the distance ratio of the map in relation to the real world. So the length between 0 and 0.5 on the map image is equal to a real world distance of one half mile.

The vicinity map shows the area of focus shown in the map, in relation to the entire covered by Atlanta Public School District. Also, please note that each white dot represents a student's address, at which, multiple students could reside. Therefore, counting the number of dots shown on the map might not reflect the student population accurately.

Live-Attend Tables

Each map has a table listing various statistics about the student data in this region. Here is a guide for reading this table:

Adamsville ES	
Total Enrollment	360
Matched	352
Unmatched	8
Out of District	3
Total Live-In	402
Live and Attend In	252
Live Out, Attend In	100
Live In, Attend Out	150

Total Enrollment – number of students attending Adamsville ES.

Matched – number of students attending Adamsville ES whose addresses were located by the GIS, and placed on the map.

Unmatched - number of students whose addresses were not able to be located, and have not been placed on the map.

Out of District – number of students who live outside of the Atlanta Public School District, yet attend this school.

Total Live-In – number of students who live within the school's attendance boundary, who are in the same grade cohort as the school. The grade cohort can change from school to school, depending on the population served. In this case, Adamsville ES enrolls Kindergarten through 5th grade students. Therefore, the 'total-live in' statistic here indicates there are 402 K-5th grade students living within the Adamsville Elementary attendance boundary.

Live and Attend In – number of students (K-5th grade) who live within the attendance boundary, and also attend that school. In this example, 252 of the 402 K-5th grade students who live within the Adamsville ES attendance boundary also attend Adamsville ES.

Live Out, Attend In – number of K-5th grade students who live outside of the Adamsville ES attendance boundary, but attend Adamsville ES. Any student records that are unmatched are not included in this count, since it is not known whether or not these unmatched students live within or outside the attendance boundary in question. Due to the methods used to calculate the statistics in this table, this is the only circumstance where this is relevant.

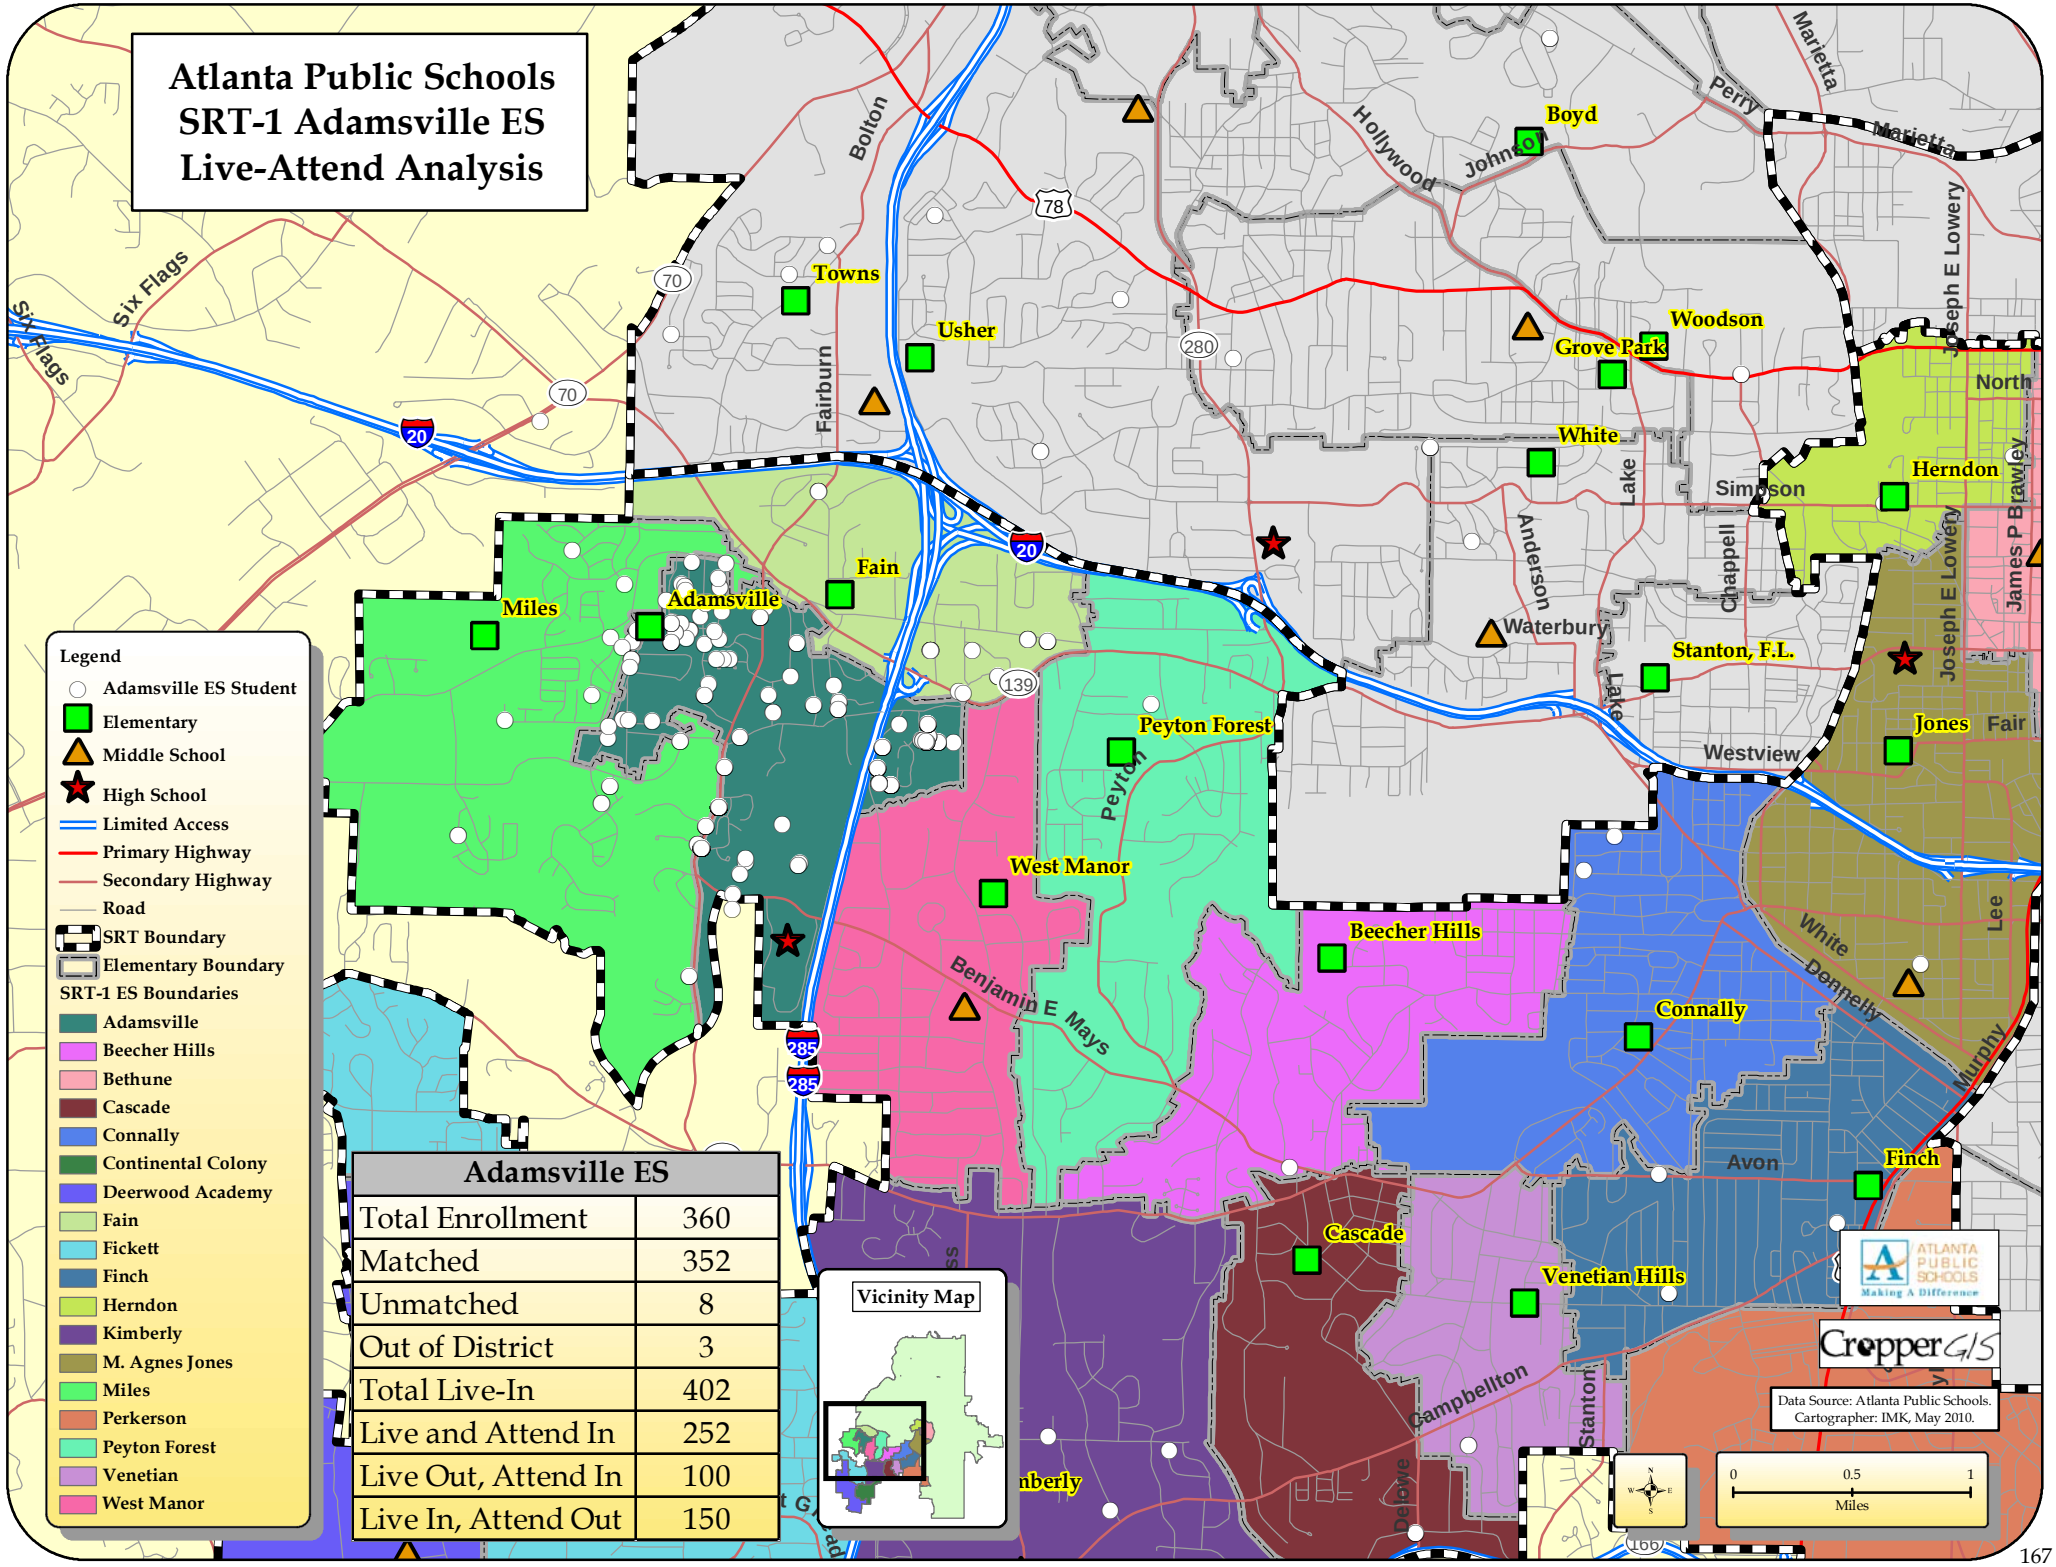

Live In, Attend Out – number of K-5th grade students who live inside the Adamsville ES attendance boundary, yet attend a different elementary school.

Student databases were utilized to perform the Live-Attend analysis. A school's enrollment is in constant flux throughout the school year as students enroll and withdraw from the system.

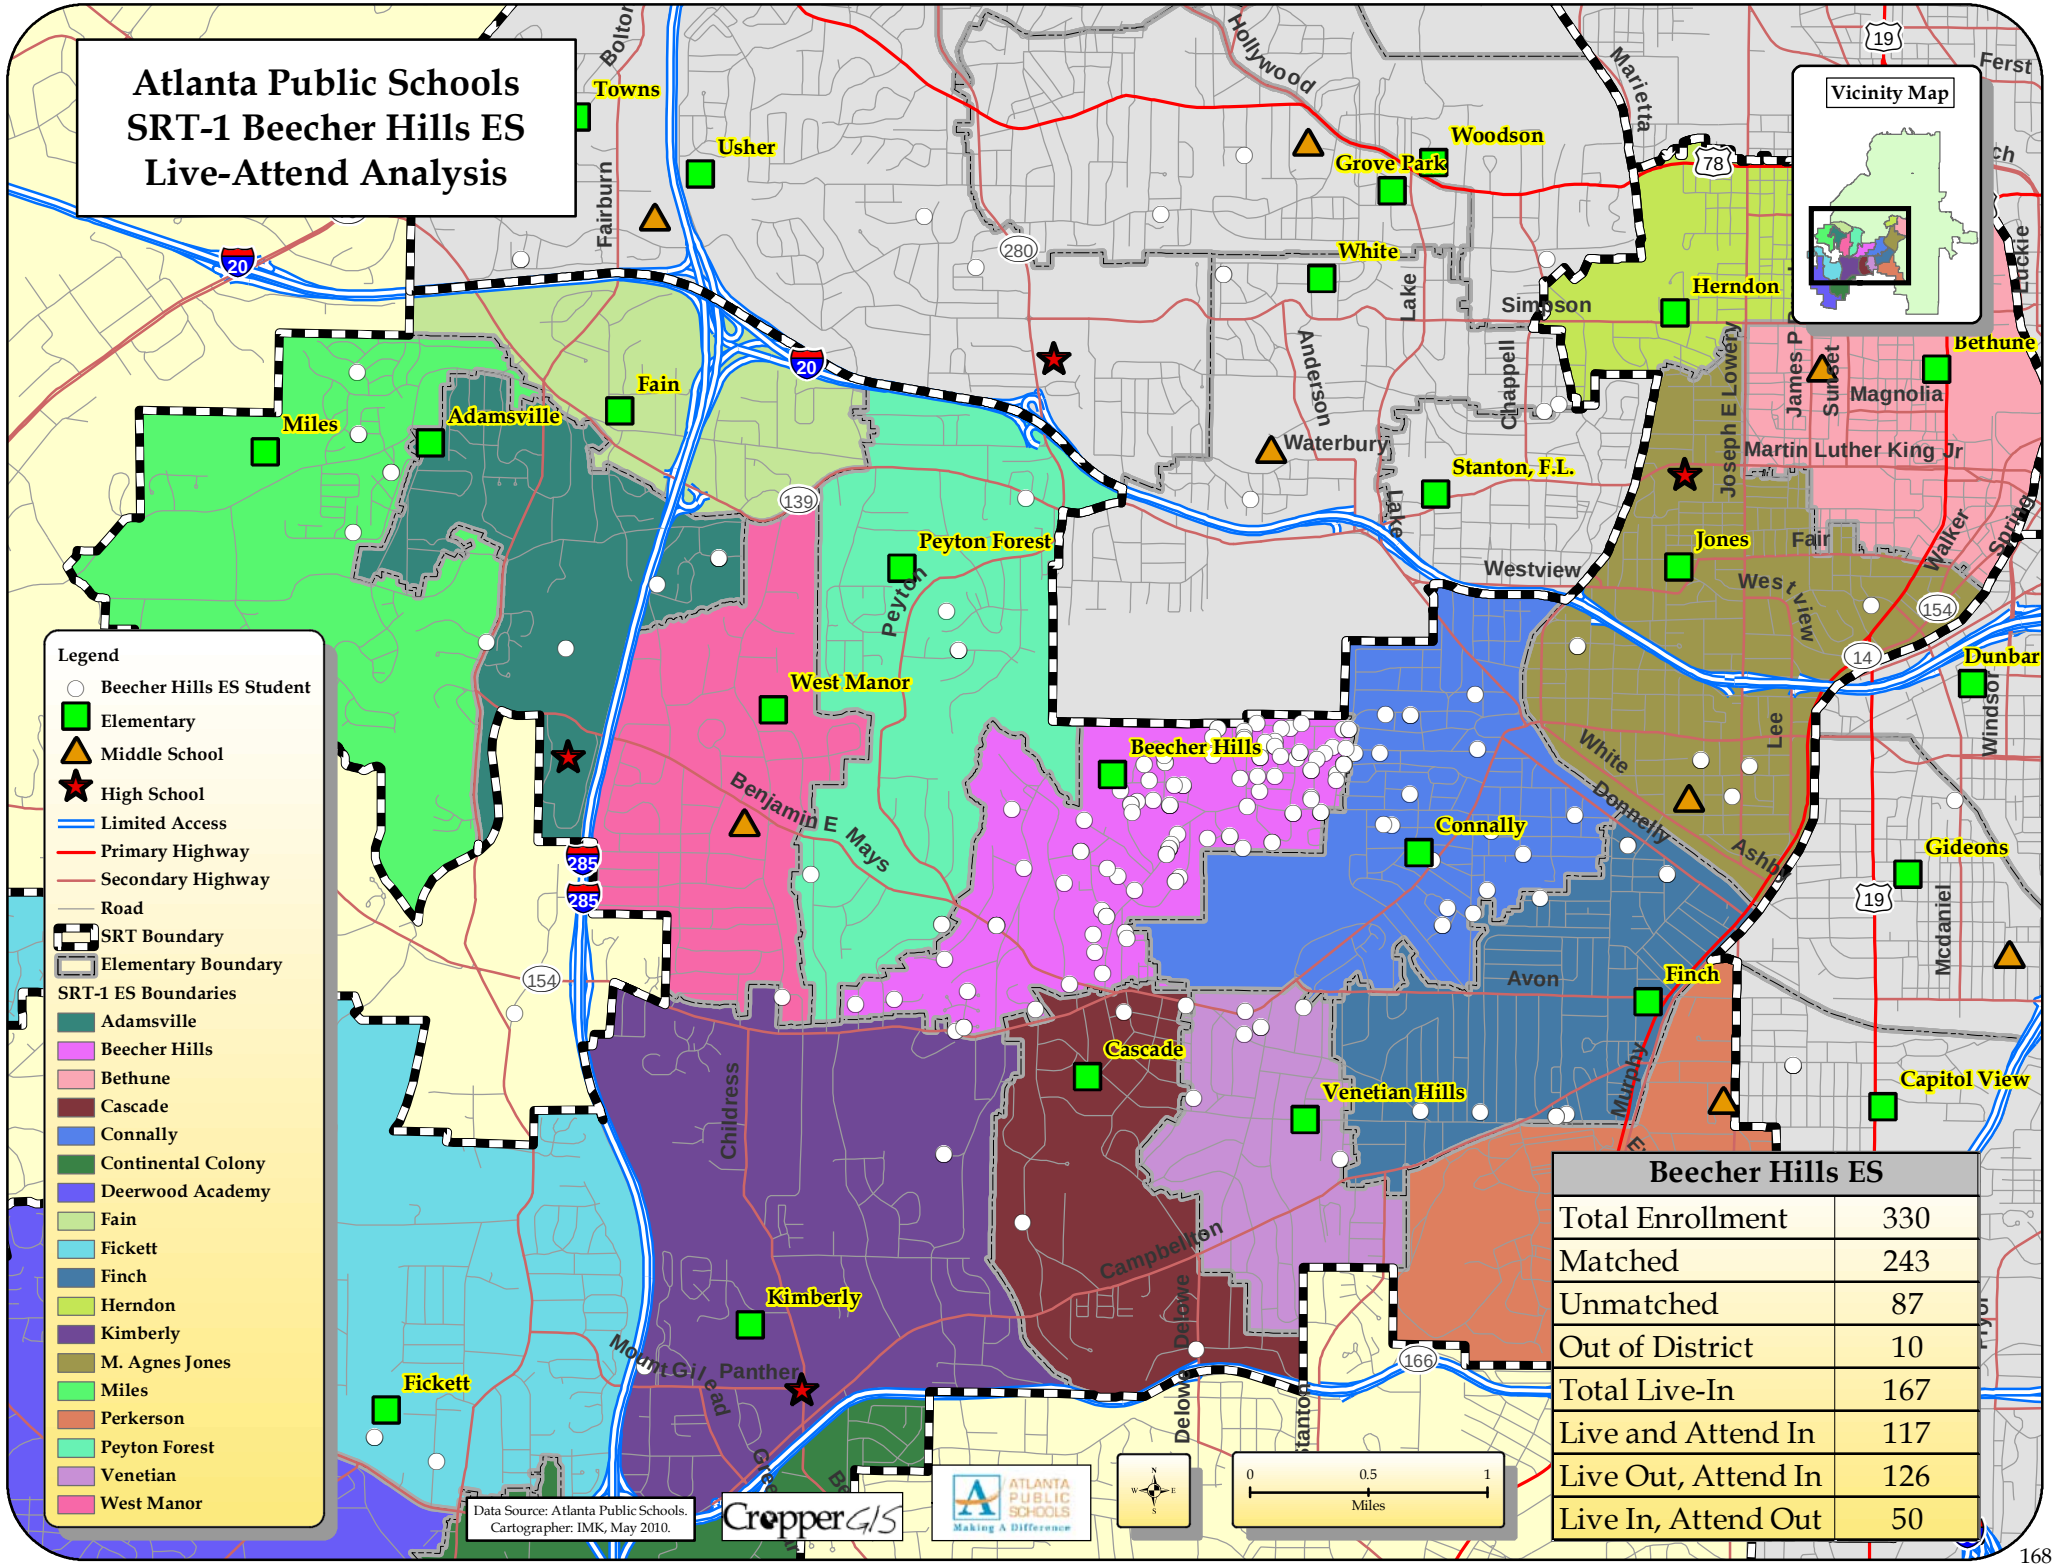

The student database was provided by Atlanta Public Schools in April 2010 and does not necessarily reflect the official enrollment that is in the enrollment forecast tables, although enrollment totals are close. The intent of the Live-Attend mapping is to analyze overall trends of where students live who attend any school. Minor differences in live-attend enrollment totals vs. official enrollment totals will not impact the integrity of the Live-Attend analysis.

HOUSING UNIT ANALYSIS

The following map series illustrates the change in housing units between 2000 and 2009. The purpose of this analysis is to gain an understanding of the current Atlanta housing stock, and then use this data in another analysis of the demographic study determining student yields.

Methodology

Housing totals from the 2000 US Census were collected at the census block level geography, which served as the baseline housing stock. Residential building permit and demolition permit data was collected from the city of Atlanta, for the years 2000 through the end of 2009. The city provided a GIS shapefile called "gis_build_bldg_permits_2000_09_st.shp," which held a total of 84,810 permit records. Many of these records were permits not related to the construction or removal of living units, but rather the modification of a property. Examples of these include (but not limited to): repair to a single family residence, alter a single family residence, residential fence/wall, etc. The records were then filtered using the "SCOPE," "SCOPE_DESC," and "SCOPE_TEXT" attribute fields to determine which permits referenced the creation or removal of living units. The following table summarizes the codes that were isolated.

	Scope Field	Scope_Desc Field
Building Codes	M1-1	Erect MF
	M1-3Conver	Convert to MF
	M2-1	Erect Residential Condominums
	M2-3Conver	Convert to Residential Condos
	M3-1	Erect Townhomes
	M5-1	Erect Residential /Commercial Bldg
	R1-1	Erect SF
	R2-1	Erect a duplex
	R2-3Conver	Convert to a duplex
Demo Codes	R1-5	Demolish SF
	R2-5	Demolish a duplex
	D1	Demolish Residential Building

Initially there were a total of 11,219 building permit records for the creation of new living units. Of these, 963 were found to be duplicate records, and were removed, bringing the total to 10,256. For demolition permits, a total of 4,275 were identified.

The number of living units associated with each permit was then calculated. This was determined using a number of factors. For instance, all records attributed as 'single-family' were assigned a living unit value of 1. For all other records, living unit values were extracted from the "SCOPE_DESC" and "SCOPE_TEXT" fields, where permit inspectors had often indicated this value. There were instances when this information was not recorded in the attribute table. In these cases, several techniques were utilized to determine the living units with a building. These methods include: contacting Atlanta area housing sources (apartment complexes, property management companies, etc), assessing building capacity via satellite imagery, and internet research.

In a few instances, clarification on the number of living units was not able to be made, and in these situations, that permit was given a living unit value of 1. There are also some instances when multiple permits were associated with a single development, and after conducting research, all the living units, at times, would be attributed to only one of the permits, while retaining the other permits in the file with no living units. Additionally, there were 24 demolition permits that did not indicate the number of living units, and these were given values of 0, as it was not possible to determine how many were removed.

Once accurate living unit totals were compiled, the file was split into four separate files:

- Single Family Building Permits
- Multi-Family Building Permits
- Single Family Demolition Permits
- Multi-Family Demolition Permits

Single Family permits were defined as permits with a living unit value of 1, and multi-family permits were defined as permits with a living units value of 2 or more. Extra attribute fields were removed to more readily allow geo-processing that would allow value summarization at a polygon level, in these case, at the Census Block level. The 2009 Atlanta Housing Stock totals were then calculated with the following formulae:

2009 Housing Stock = 2000 US Census Housing Totals + Single & Multi Family Living Units Created – Single & Multi-Family Living Units removed

These figures were also compiled at the elementary attendance area level geography.

A proportional estimation was used to calculate the 2009 single-family and multi-family housing unit breakdown. While the methods used to calculate the new overall 2009 housing stock totals does accommodate specific living unit figures for these categories, the 2000 Census baseline data does not contain the same figures (single & multi-family living units). The estimation of the 2009 housing unit type was calculated by creating a proportion of the number of owner-occupied (representing single family units) and renter-occupied (representing multi-family units) from the 2000 housing stock baseline, and applying that proportion to the 2009 housing stock totals. This proportion does not account for vacant housing units. This analysis is suited to serve more as a generalization rather than a precise account of single and multi-family housing units.

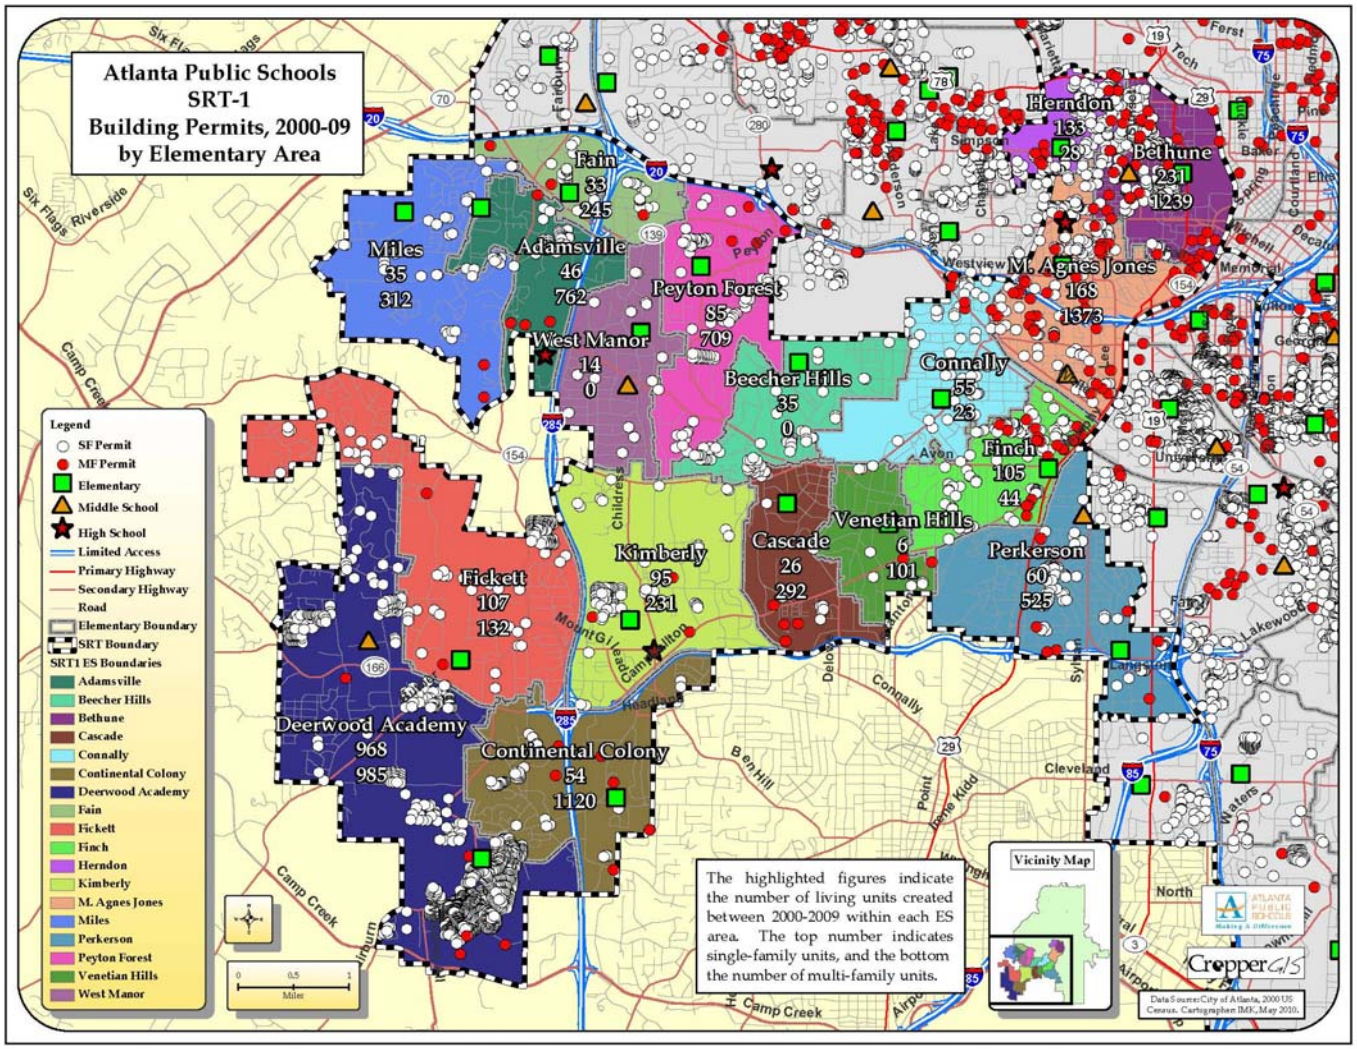

Included In this Series

- Total Housing Units, 2000 by Elementary Area
- Building Permits, 2000-2009 by Elementary Area
- Demolition Permits, 2000-2009, by Elementary Area
- Single Family Housing Units, 2009, by Elementary Area
- Multi-Family Housing Units, 2009, by Elementary Area
- Total Housing Units, 2009, by Elementary Area
- Housing Unit Change, 2000-2009, by Elementary Area

Map Interpretation

The following explanations are guides for interpreting maps found in this series. It is important to be aware of how each map is illustrating data to ensure an accurate understanding is possible. For instance, there are often similar features found in different maps, such as labels and area colors, but their meaning can change depending on what each map is depicting. Please familiarize yourself with all aspects of any given map prior to making a complete interpretation.

Point Distribution Map

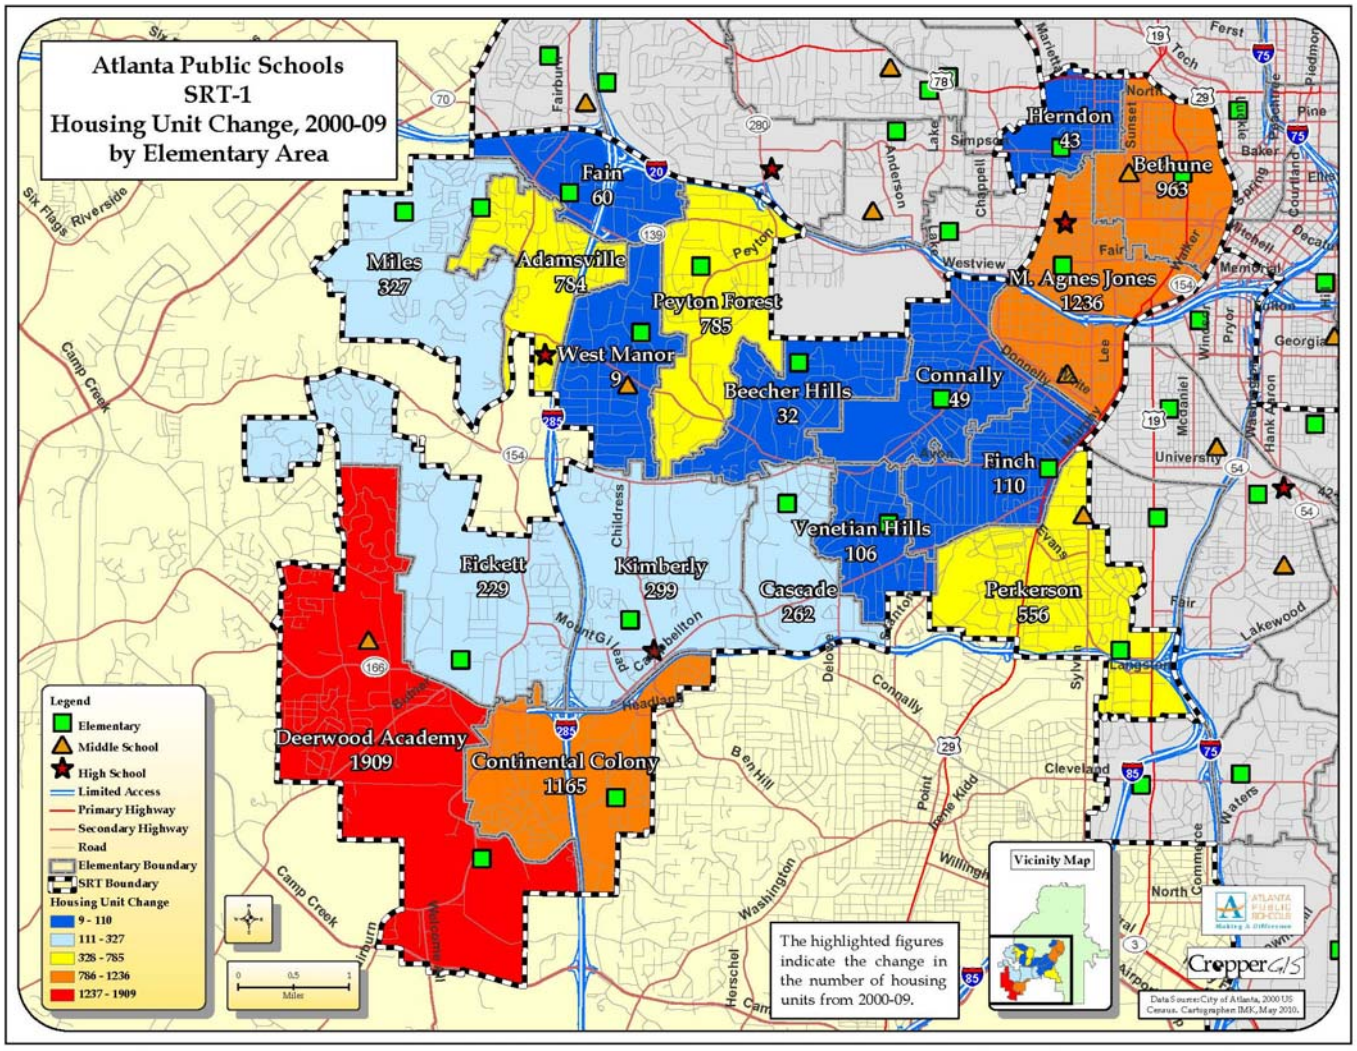

This map shows the point location of a certain data. In this case, it shows the location of building permits between 2000-09. Each white point represents a single family building permit, and each red dot represents a multi-family building permit. It is not practical to count each point visually to ascertain the total number of points however. The purpose of this mapping visual is to illustrate the distribution of point data across an area.

The white labels beneath each attendance area name label indicate the total number of living units created during the time period. The top figure show single-family living units, and the bottom figure shows multi-family living units. Please note that building permits and living units are not the same figure. For instance, one building permit could have 10 living units associated with it. This generally only occurs with multi-family building permits however.

The attendance areas have been given a random color scheme, and do not represent any statistical value in this type of map.

Choropleth Map

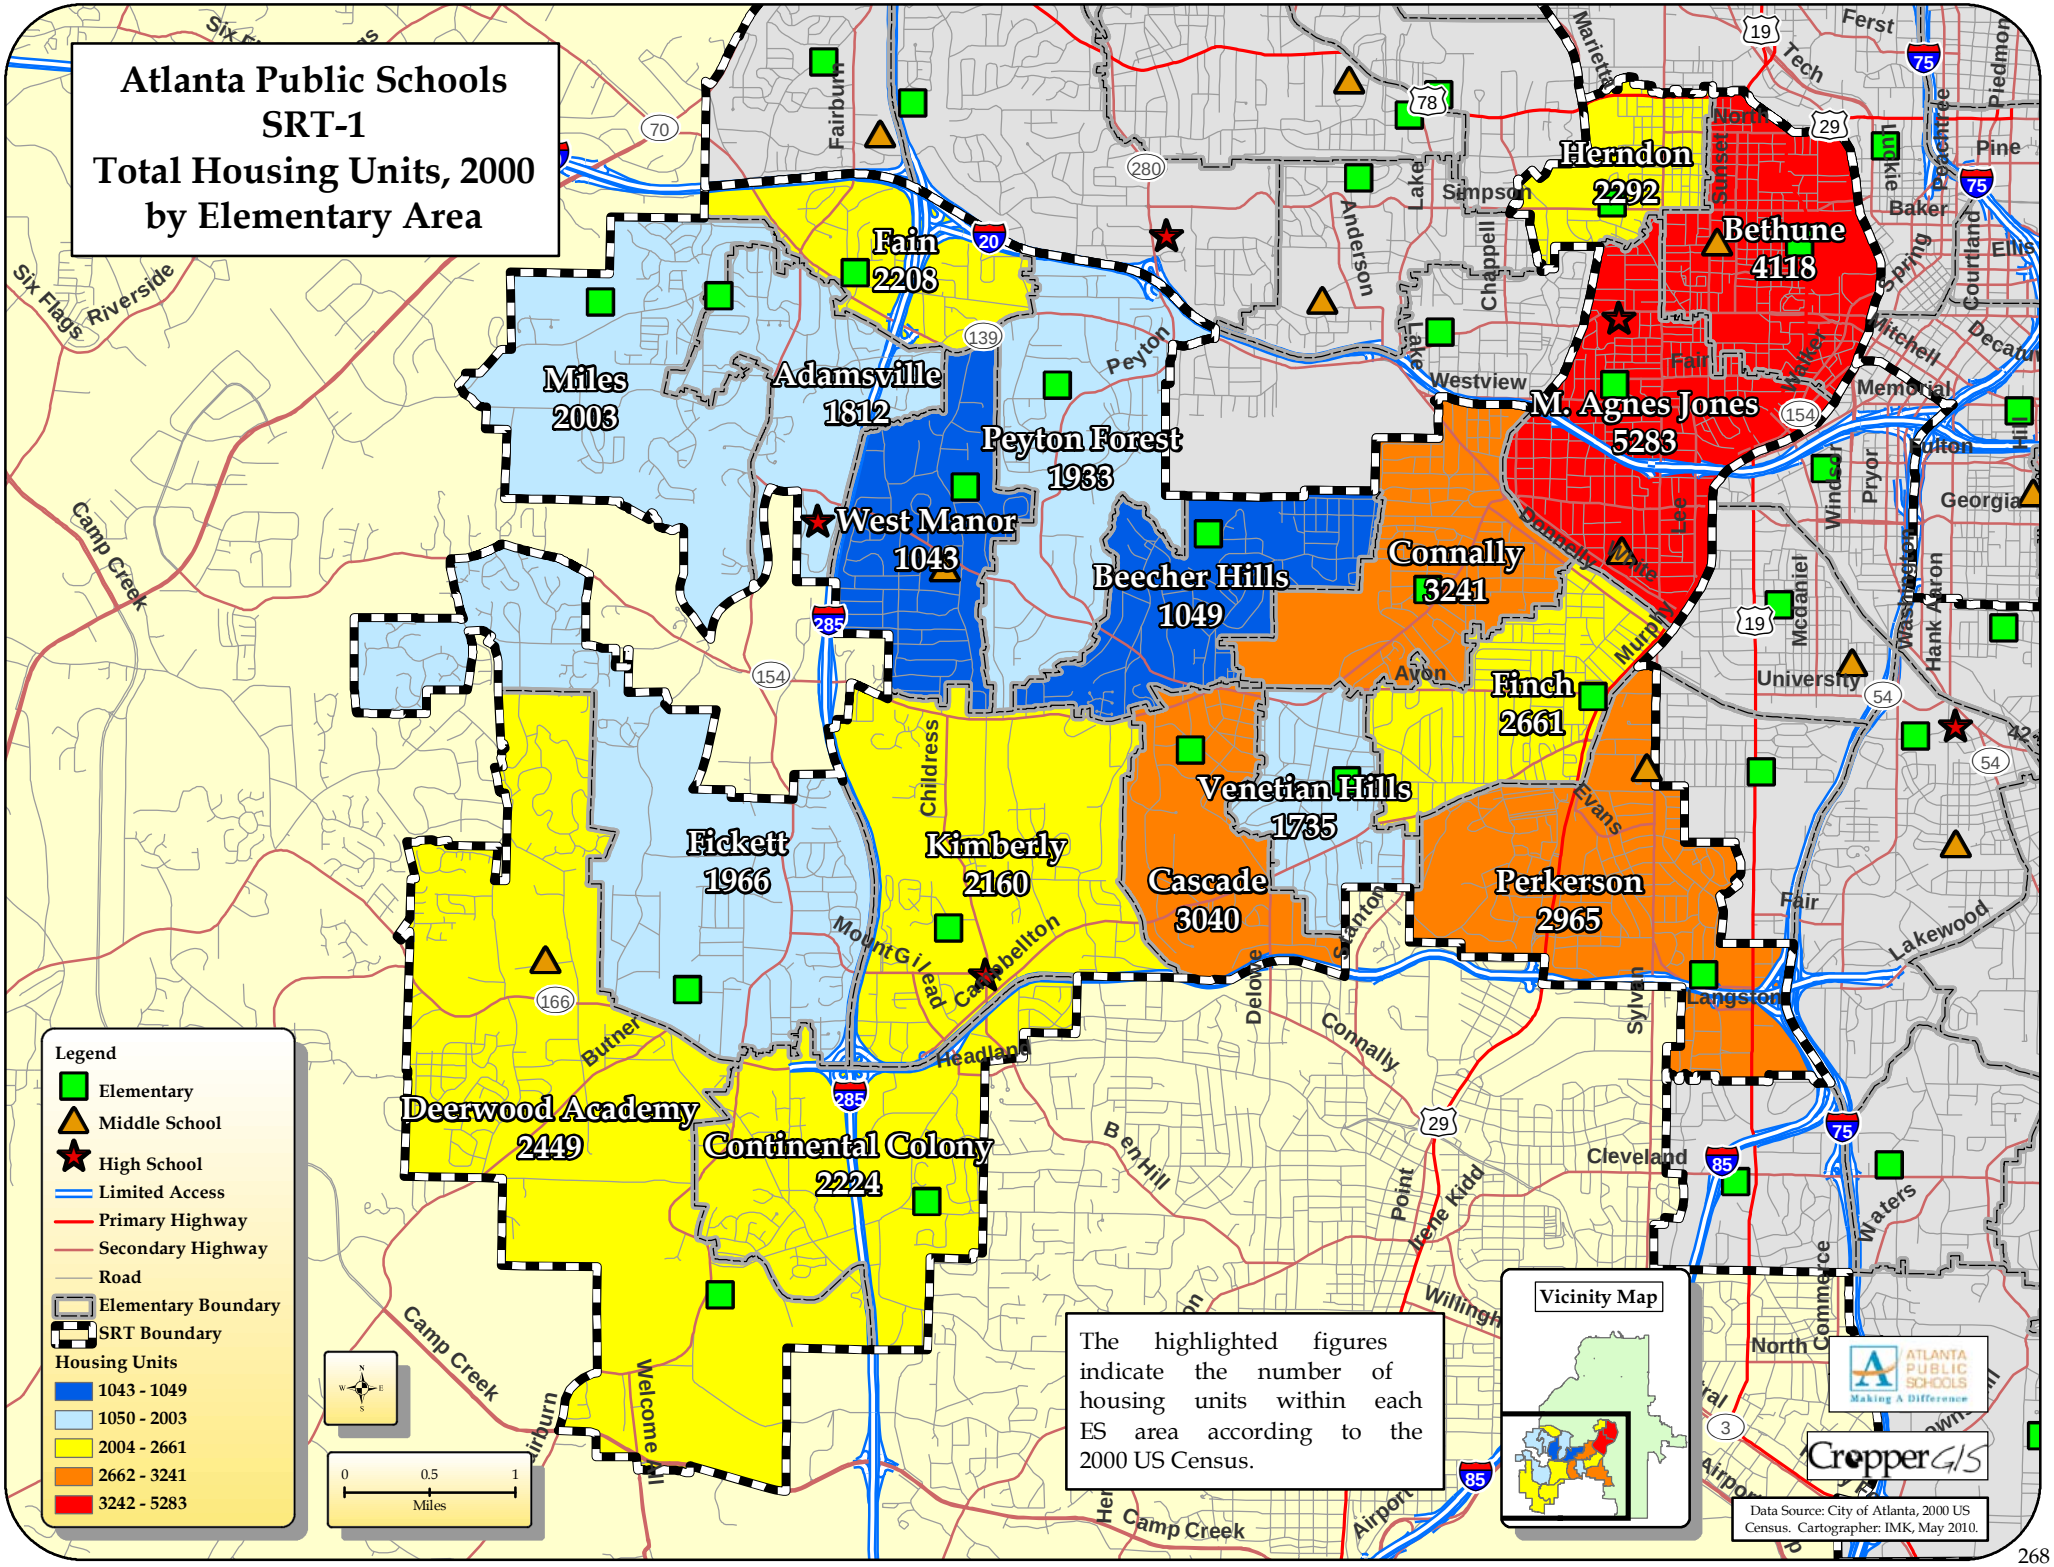

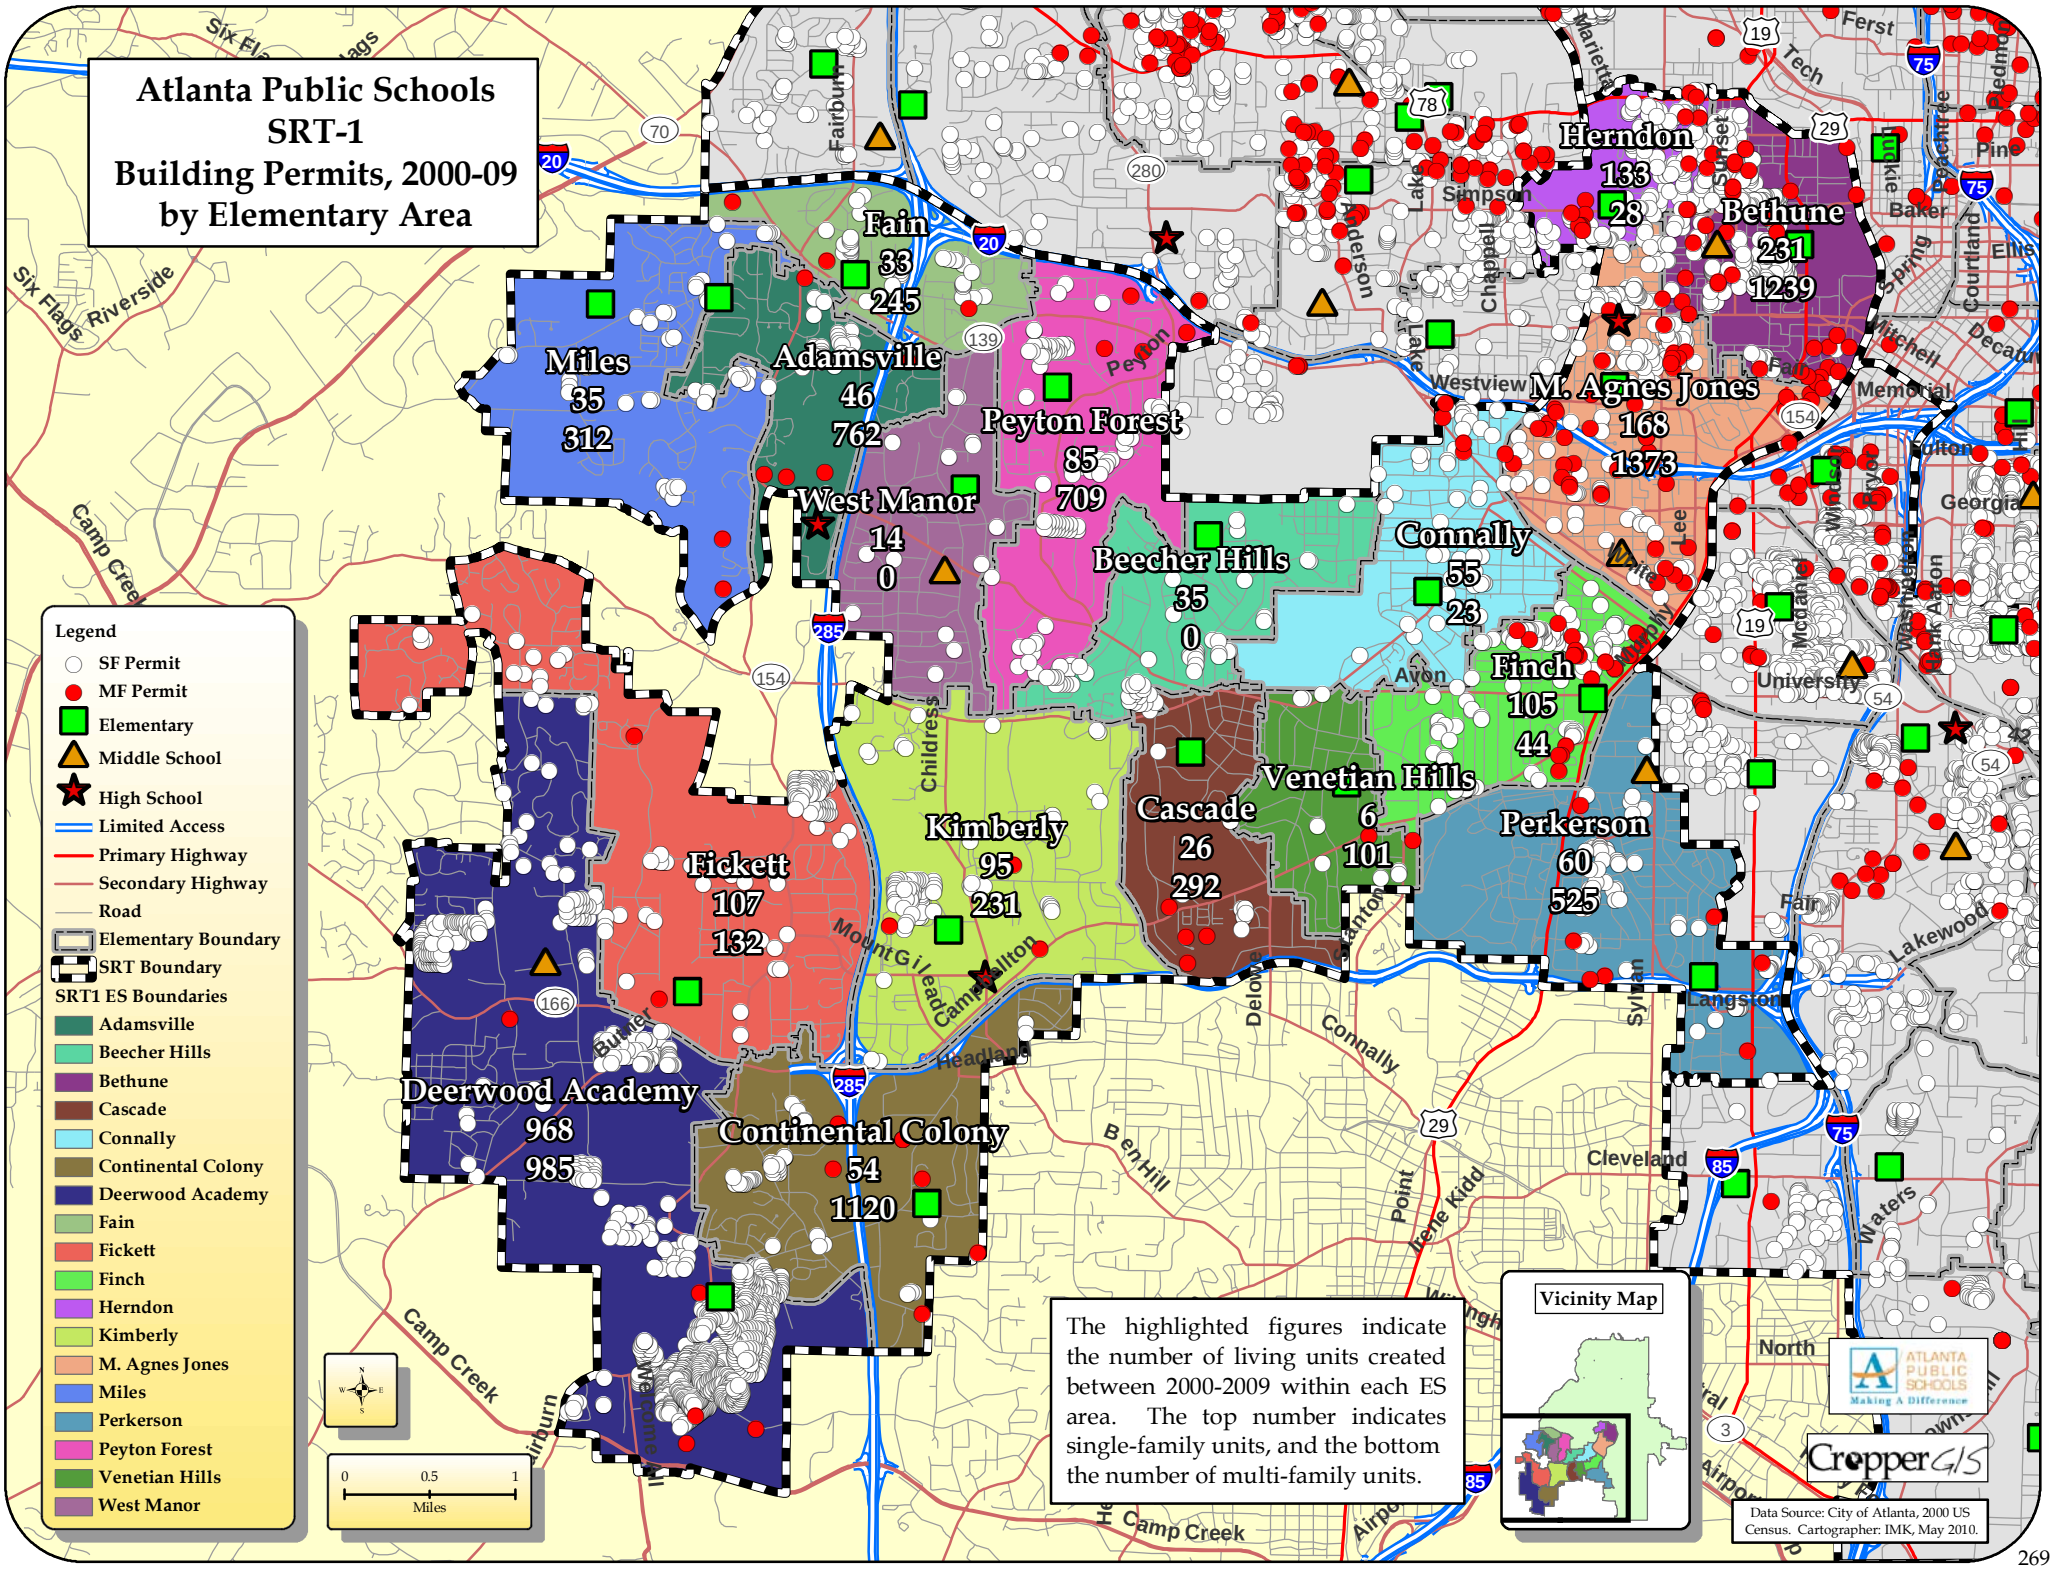

This type of map shows different values according to a geographic area, in this case elementary attendance area. The attendance areas will fall somewhere on a color ramp between blue and red. The blue colors indicate a lower value while the red colors represent a higher value. Please note that in some instances the blue values could show a negative value, for instance if a decrease occurred in a given area. The numbers in white below each attendance area's name label indicates the value change for that area. Be aware that some maps of this type do not show change, but rather show only a statistic, such as total housing units.

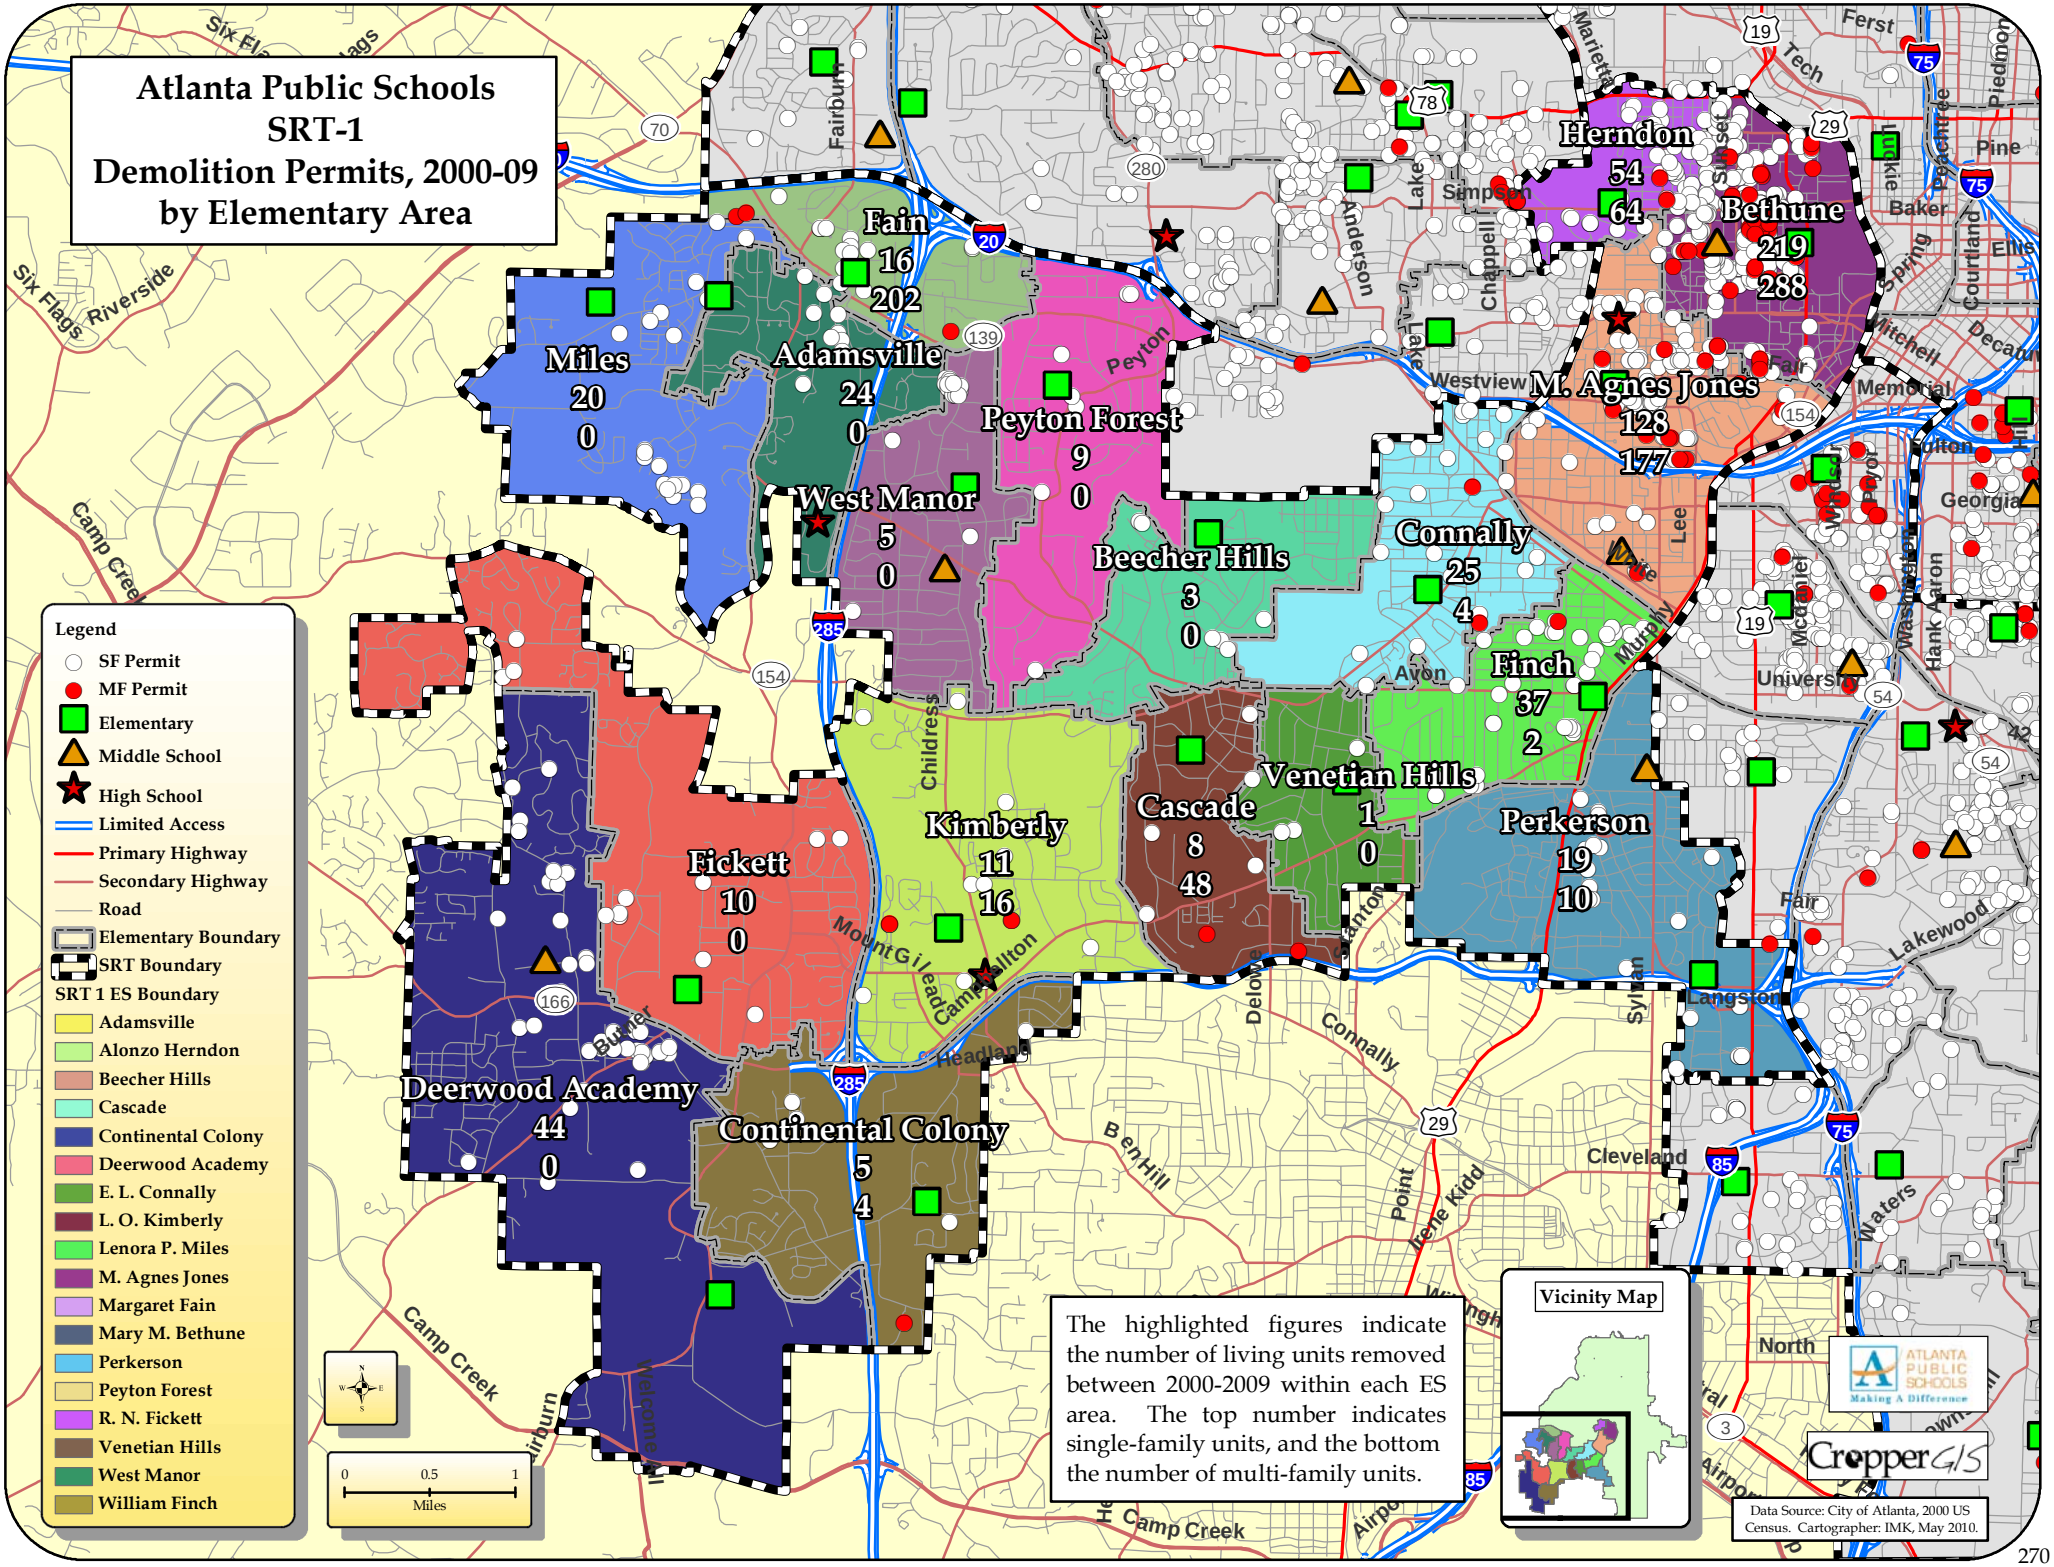

In general, for any map type, specific instructions for interpretation can be found in white boxes placed on each map.

STUDENT YIELD ANALYSIS

This map series illustrates student yield by elementary attendance area. This analysis utilized housing totals calculated in the housing unit examination detailed in another section of this report, along with the 2009-10 school year student data provided by APS. Student yield is calculated by dividing the total number of students by the total number of housing units within a given geography (Student Yield = Students/Housing Units). For example, if an attendance area shows 250 students residing within its area, and a total of 1000 housing units exist, the resulting student yield would be 0.25 students per housing unit (student yield = 250/1000 = 0.25).

When considering the student yields shown by single-family or multi-family housing unit type (in the tables found on each map), please note that these represent a proportion of students according to the proportion of housing unit type found within each area. In other words, students were not able to be link geographically to the housing type they reside in to calculate the exact yield for that housing type.

For example, if a given area has a total of 250 students, and it is known that 150 reside in single-family units and 100 reside in multi-family units, while it is also known that a total of 1000 housing units exist, with 750 of these being single family and 250 being multi-family units. The resulting single-family student yield would be 0.2 students per unit (single family student yield = 150 students/750 single-family units) and the resulting multi-family student yield would be 0.4 students per unit (multi-family student yield = 100 students/250 multi-family units). This method allows for precise correlation between each student's housing residence type and the total number of each housing type within an area.

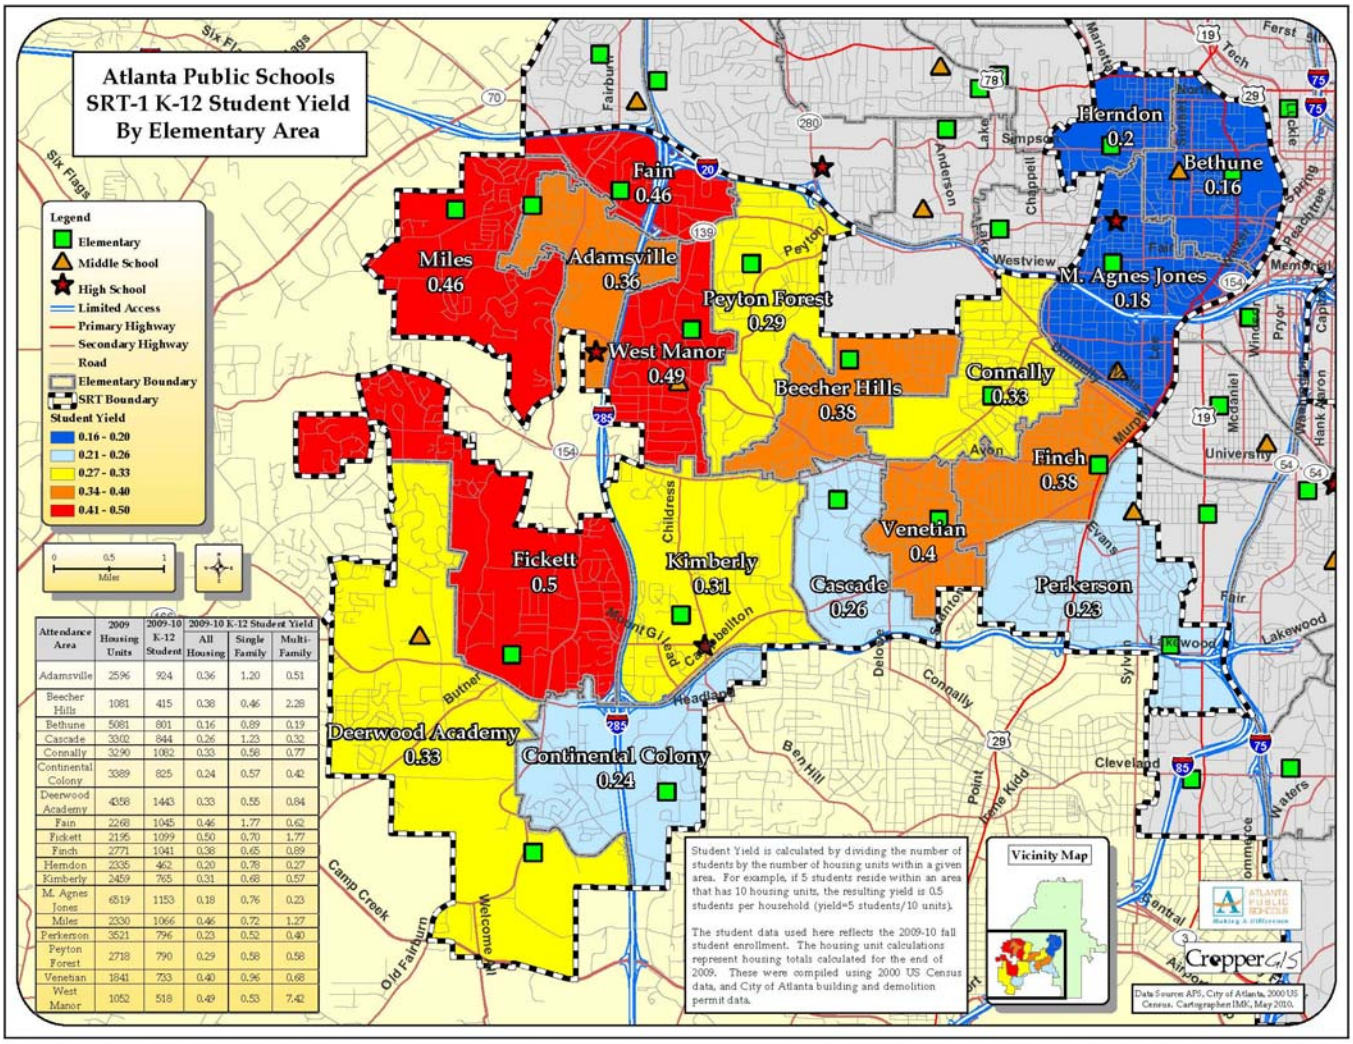

Due to the methods used to calculate housing unit totals based on the forms of available data, the formerly mentioned method for calculating single and multi-family student yields was not accessible, and a more generalized approach was utilized. The method used in this analysis examined the total number of students and housing unit type within an area, without geo-referencing the students to a particular housing unit type.

Included In this Series

- K-12 Student Yield by Elementary Area
- K-5 Student Yield by Elementary Area
- Grade 6th-8th Student Yield by Elementary Area
- Grade 9th-12th Student Yield by Elementary Area

Map Interpretation

This type of map shows different values according to a geographic area, in this case elementary attendance area. The attendance areas will fall somewhere on a color ramp between blue and red. The blue colors indicate a lower value while the red colors represent a higher value. The numbers in white below each attendance area's name label indicates the 2009-10 student yield, for the cohort being mapped. The table located on each map shows some of the figures used to calculate student yields, along with student yield by housing type. These tables are also available separately in this appendix.

Student Yield is calculated by dividing the number of students by the number of housing units within a given area. For example, if 5 students reside within an area that has 10 housing units, the resulting yield is 0.5 students per household (yield=5 students/10 units).

The student data used here reflects the 2009-10 fall student enrollment. The housing unit calculations represent housing totals calculated for the end of 2009. These were compiled using 2000 US Census data, and City of Atlanta building and demolition permit data.

Data Source: APS, City of Atlanta, 2000 US Census. Cartographer: IMK, May 2010.

STUDENT YIELD ANALYSIS

Atlanta Public Schools SRT-3 K-12 Student Yield By Elementary Area

Student Yield is calculated by dividing the number of students by the number of housing units within a given area. For example, if 5 students reside within an area that has 10 housing units, the resulting yield is 0.5 students per household (yield=5 students/10 units).

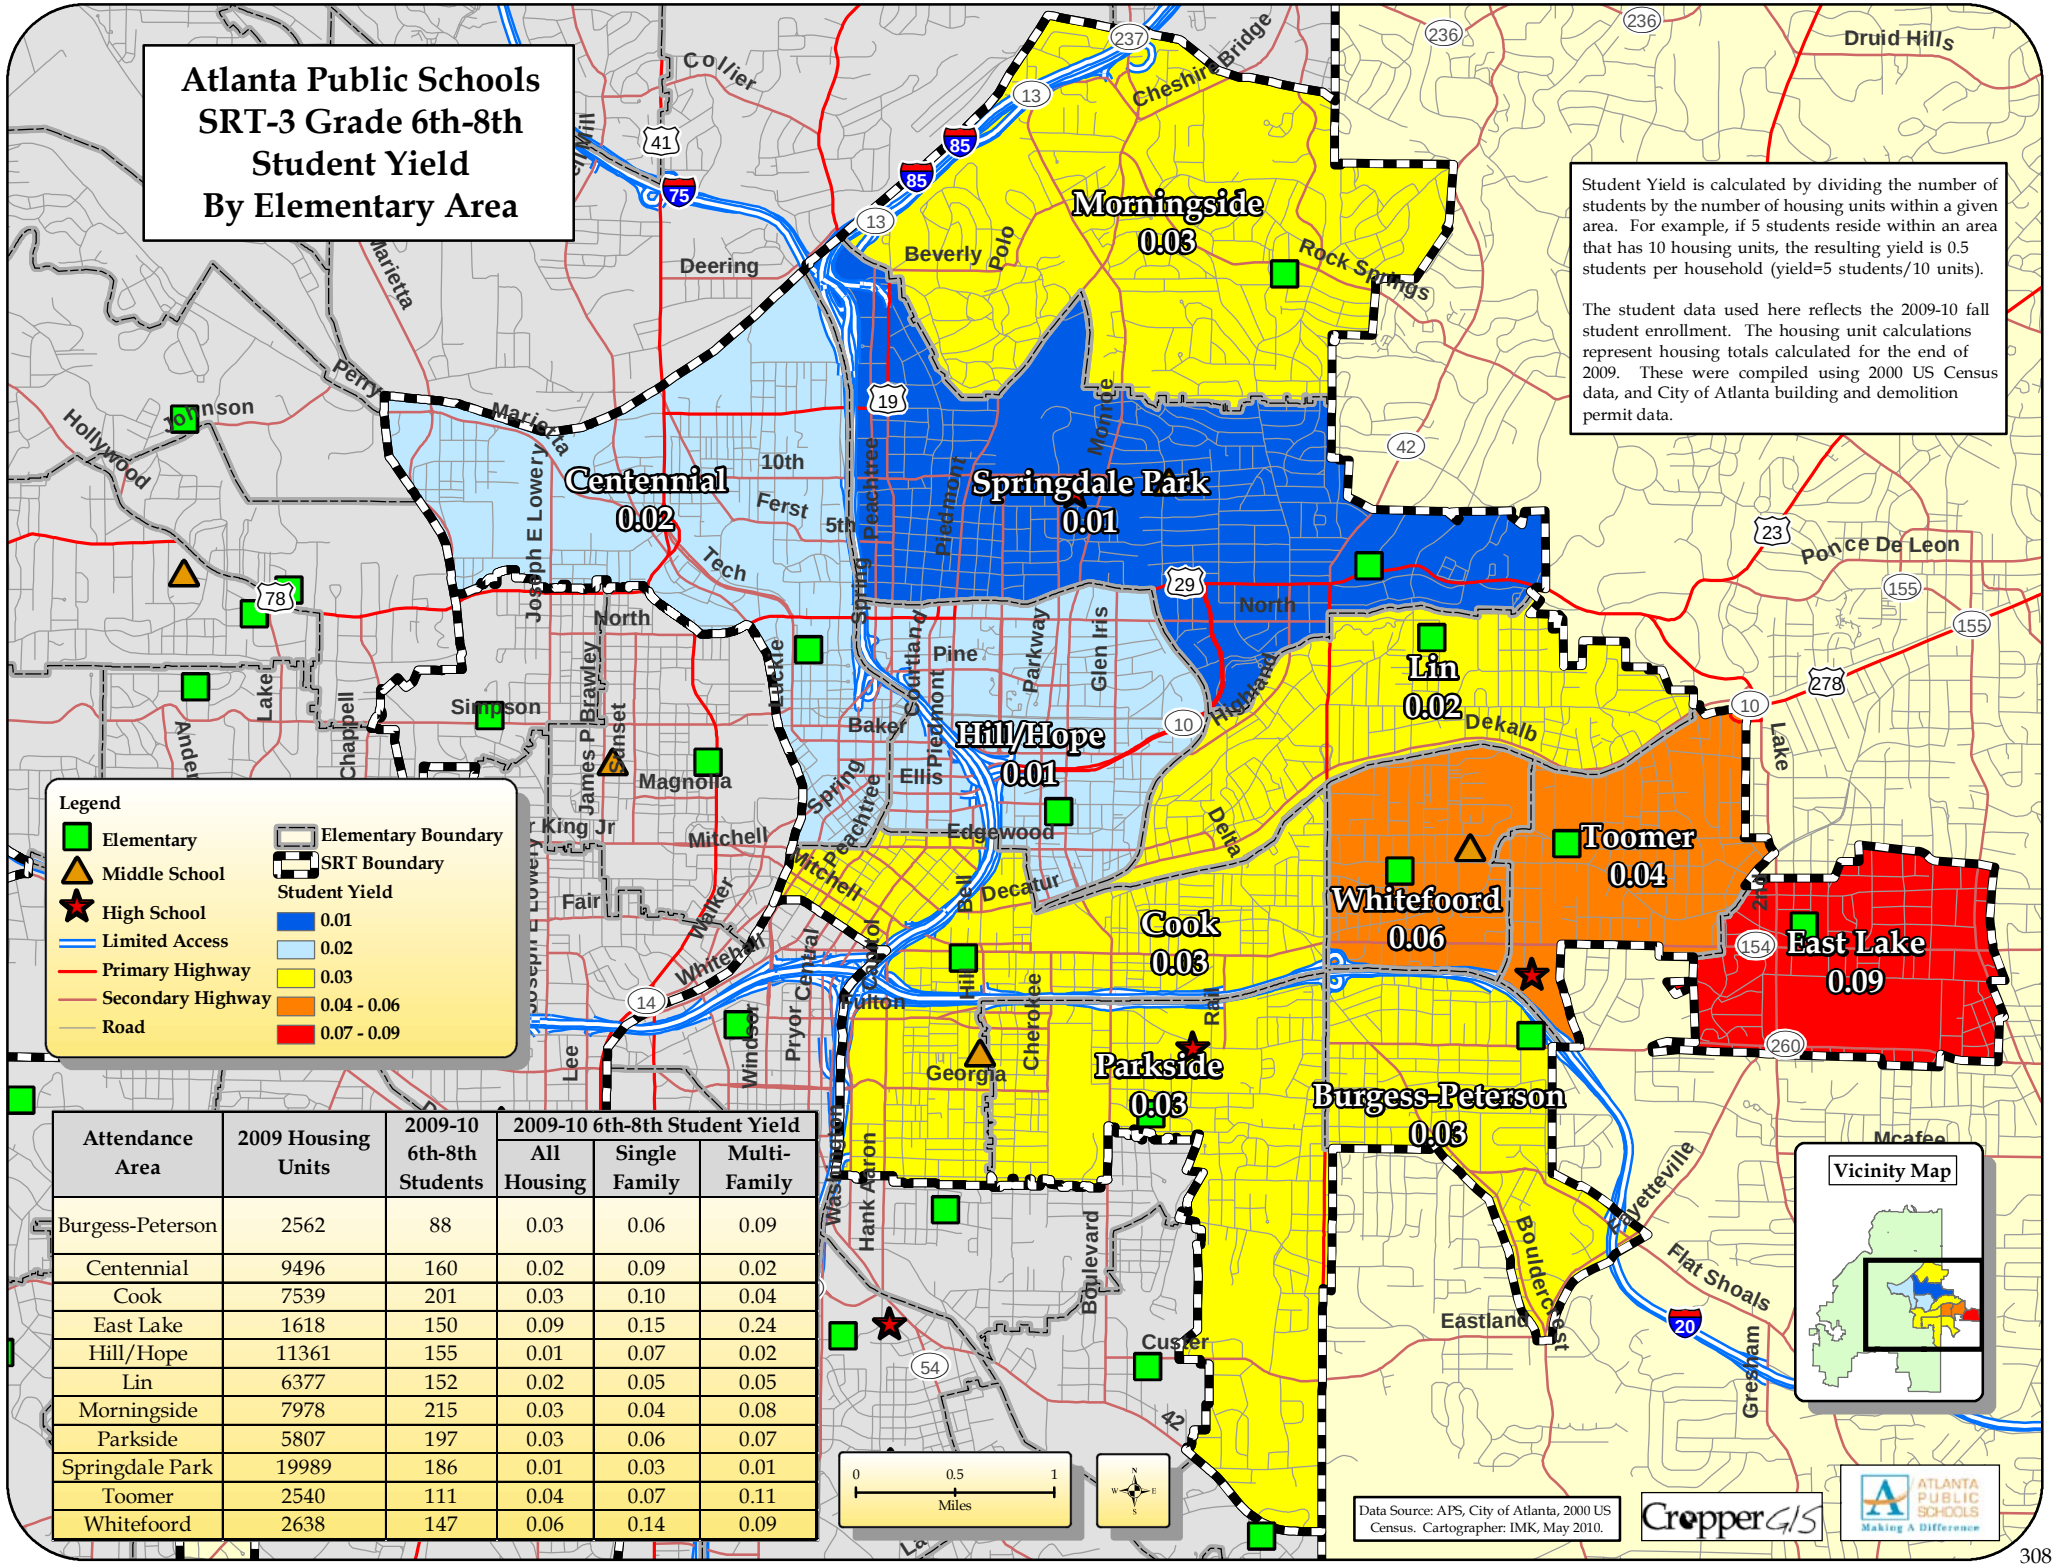

The student data used here reflects the 2009-10 fall student enrollment. The housing unit calculations represent housing totals calculated for the end of 2009. These were compiled using 2000 US Census data, and City of Atlanta building and demolition permit data.

Attendance Area	2009 Housing Units	2009-10 K-12 Students	2009-10 K-12 Student Yield
